CODE • COMMIT • TRUST

Thank you

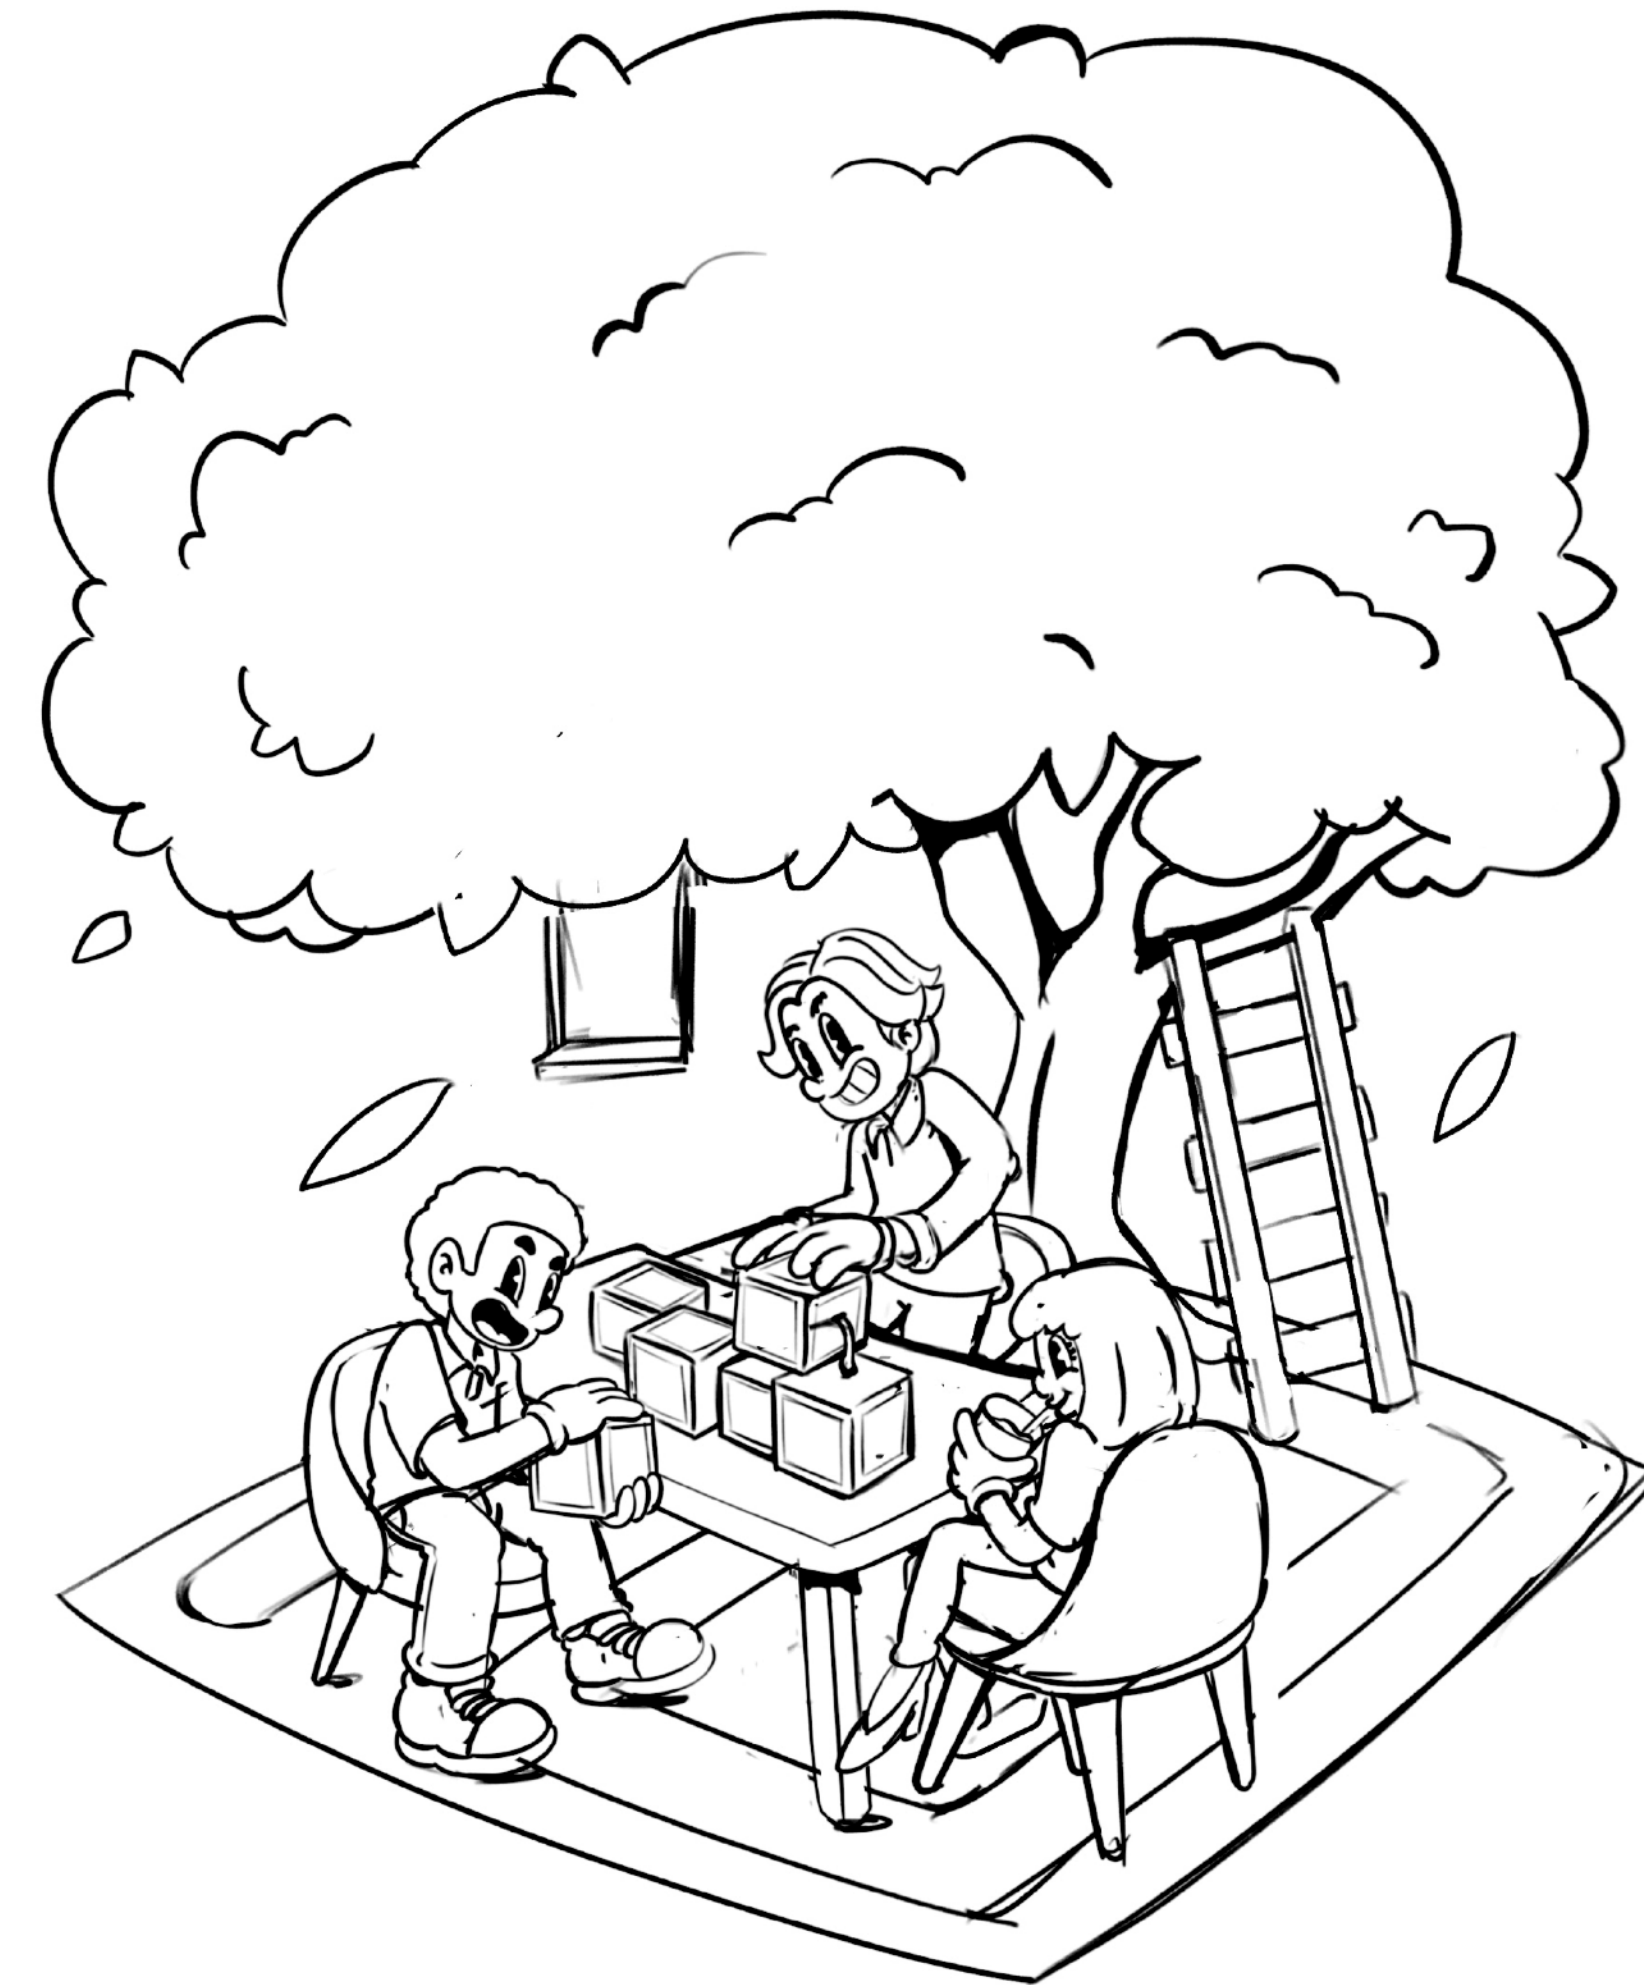

Schedule

- 10:00 - 10:30: Doors Open
- 10:30 - 10:45: Welcome
- 10:45 - 11:15: Why community matters
- 11:15 - 11:45: Keynote
- 11:45 - 12:00: Coffee break

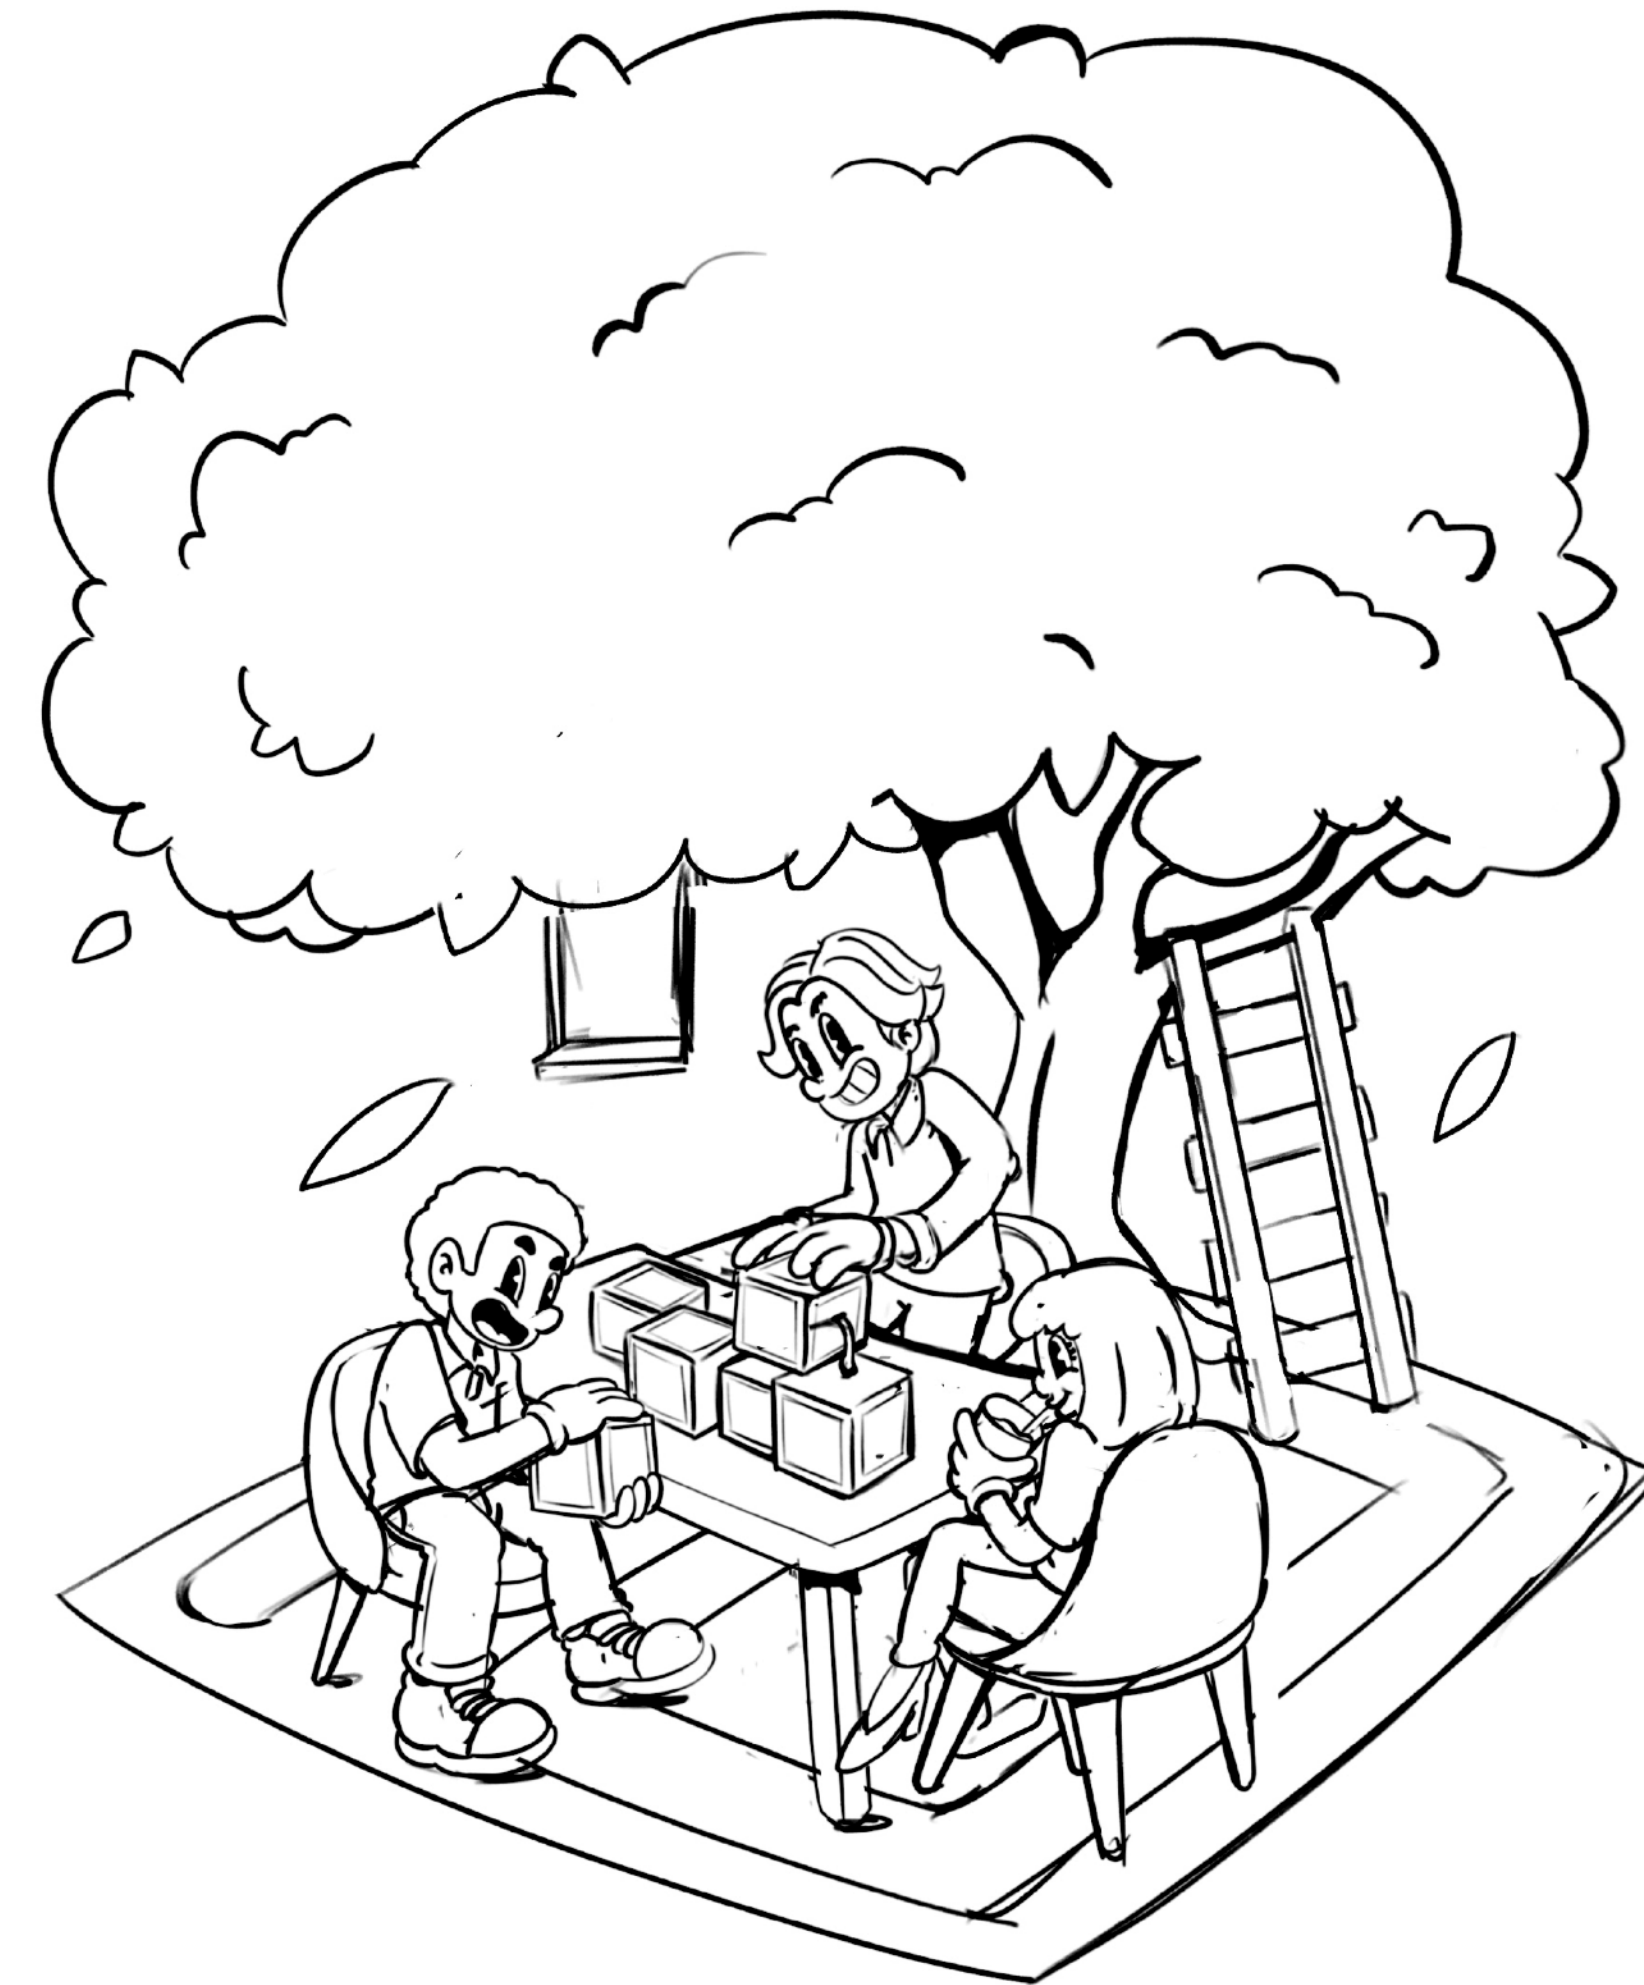

Schedule

- 12:00 - 12:30: Agentic AI on Hiero
- 12:30 - 13:00: How SDKs evolve as a diverse community project
- 13:00 - 14:00: Break and Networking
- 14:00 - 14:30: Proof of Personhood: Authentication in the Age of AI

Schedule

- 14:30 - 15:00: Hiero Heka
- 15:00 - 15:30: Solo and Solo Action
- 15:30 - 16:00: Coffee break
- 16:00 - 17:00: Hiero TSC Call live on stage
- 17:00 - 21:00: Networking

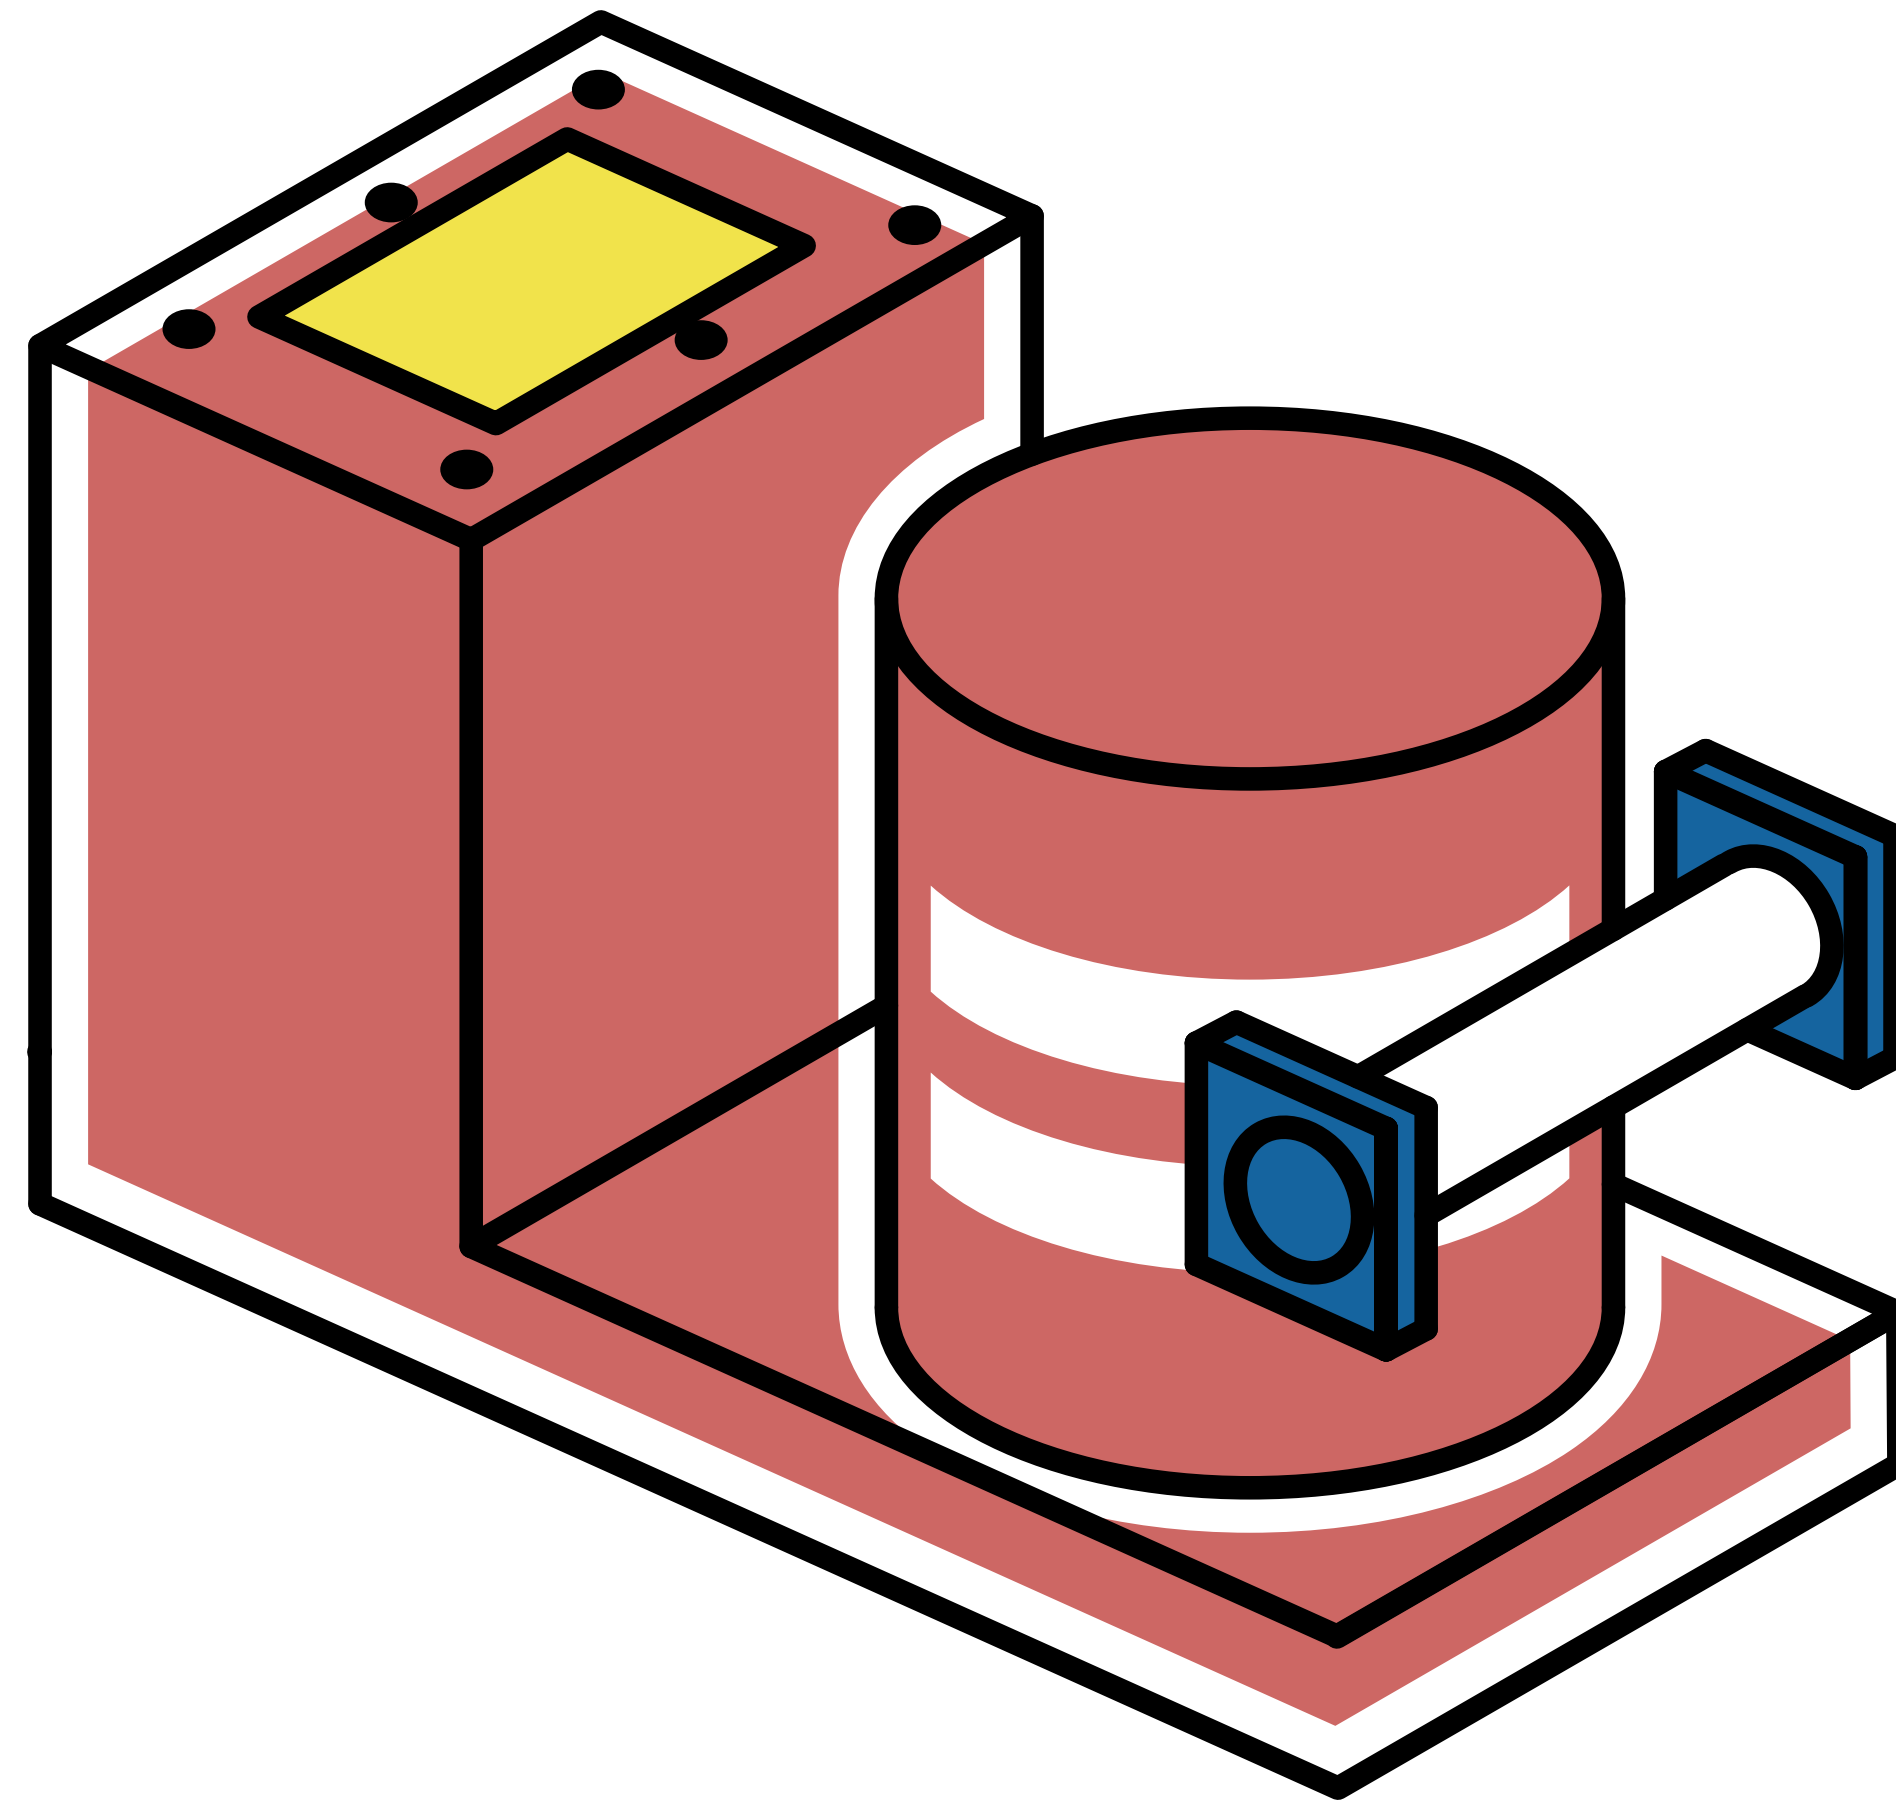

Web3 is dead

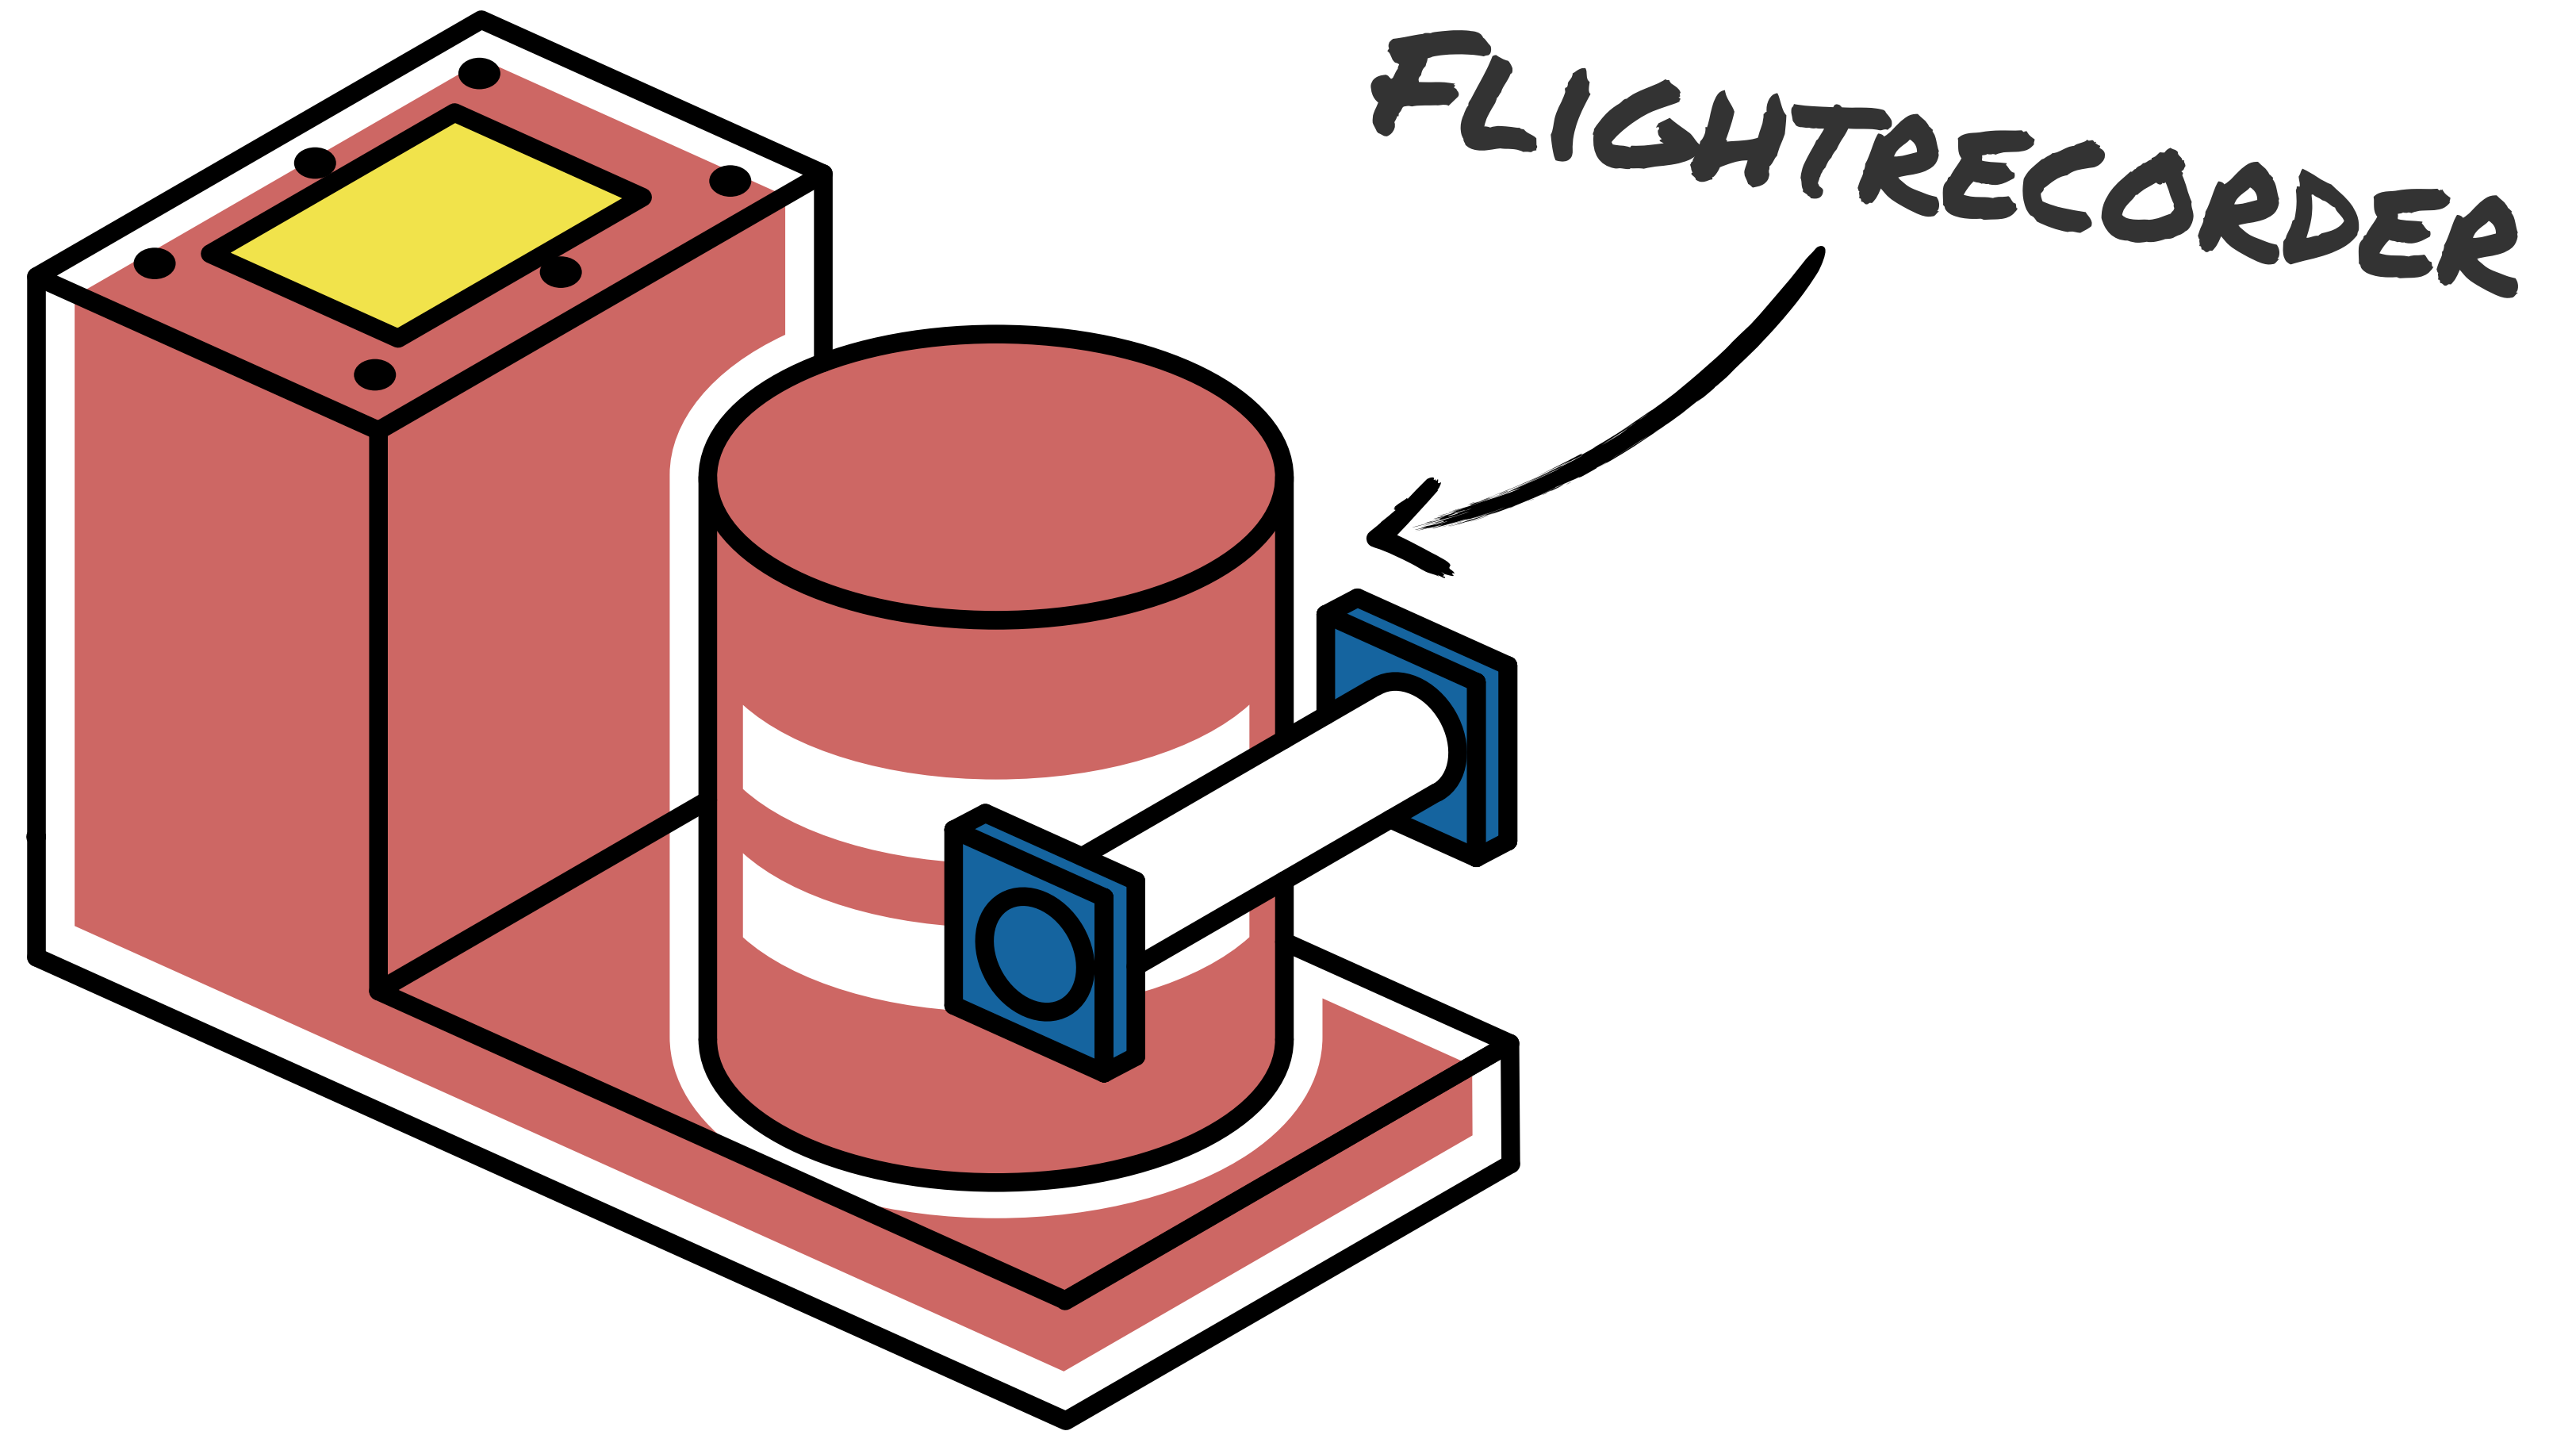

Blockchain is dead

**... or maybe it has just
changed**

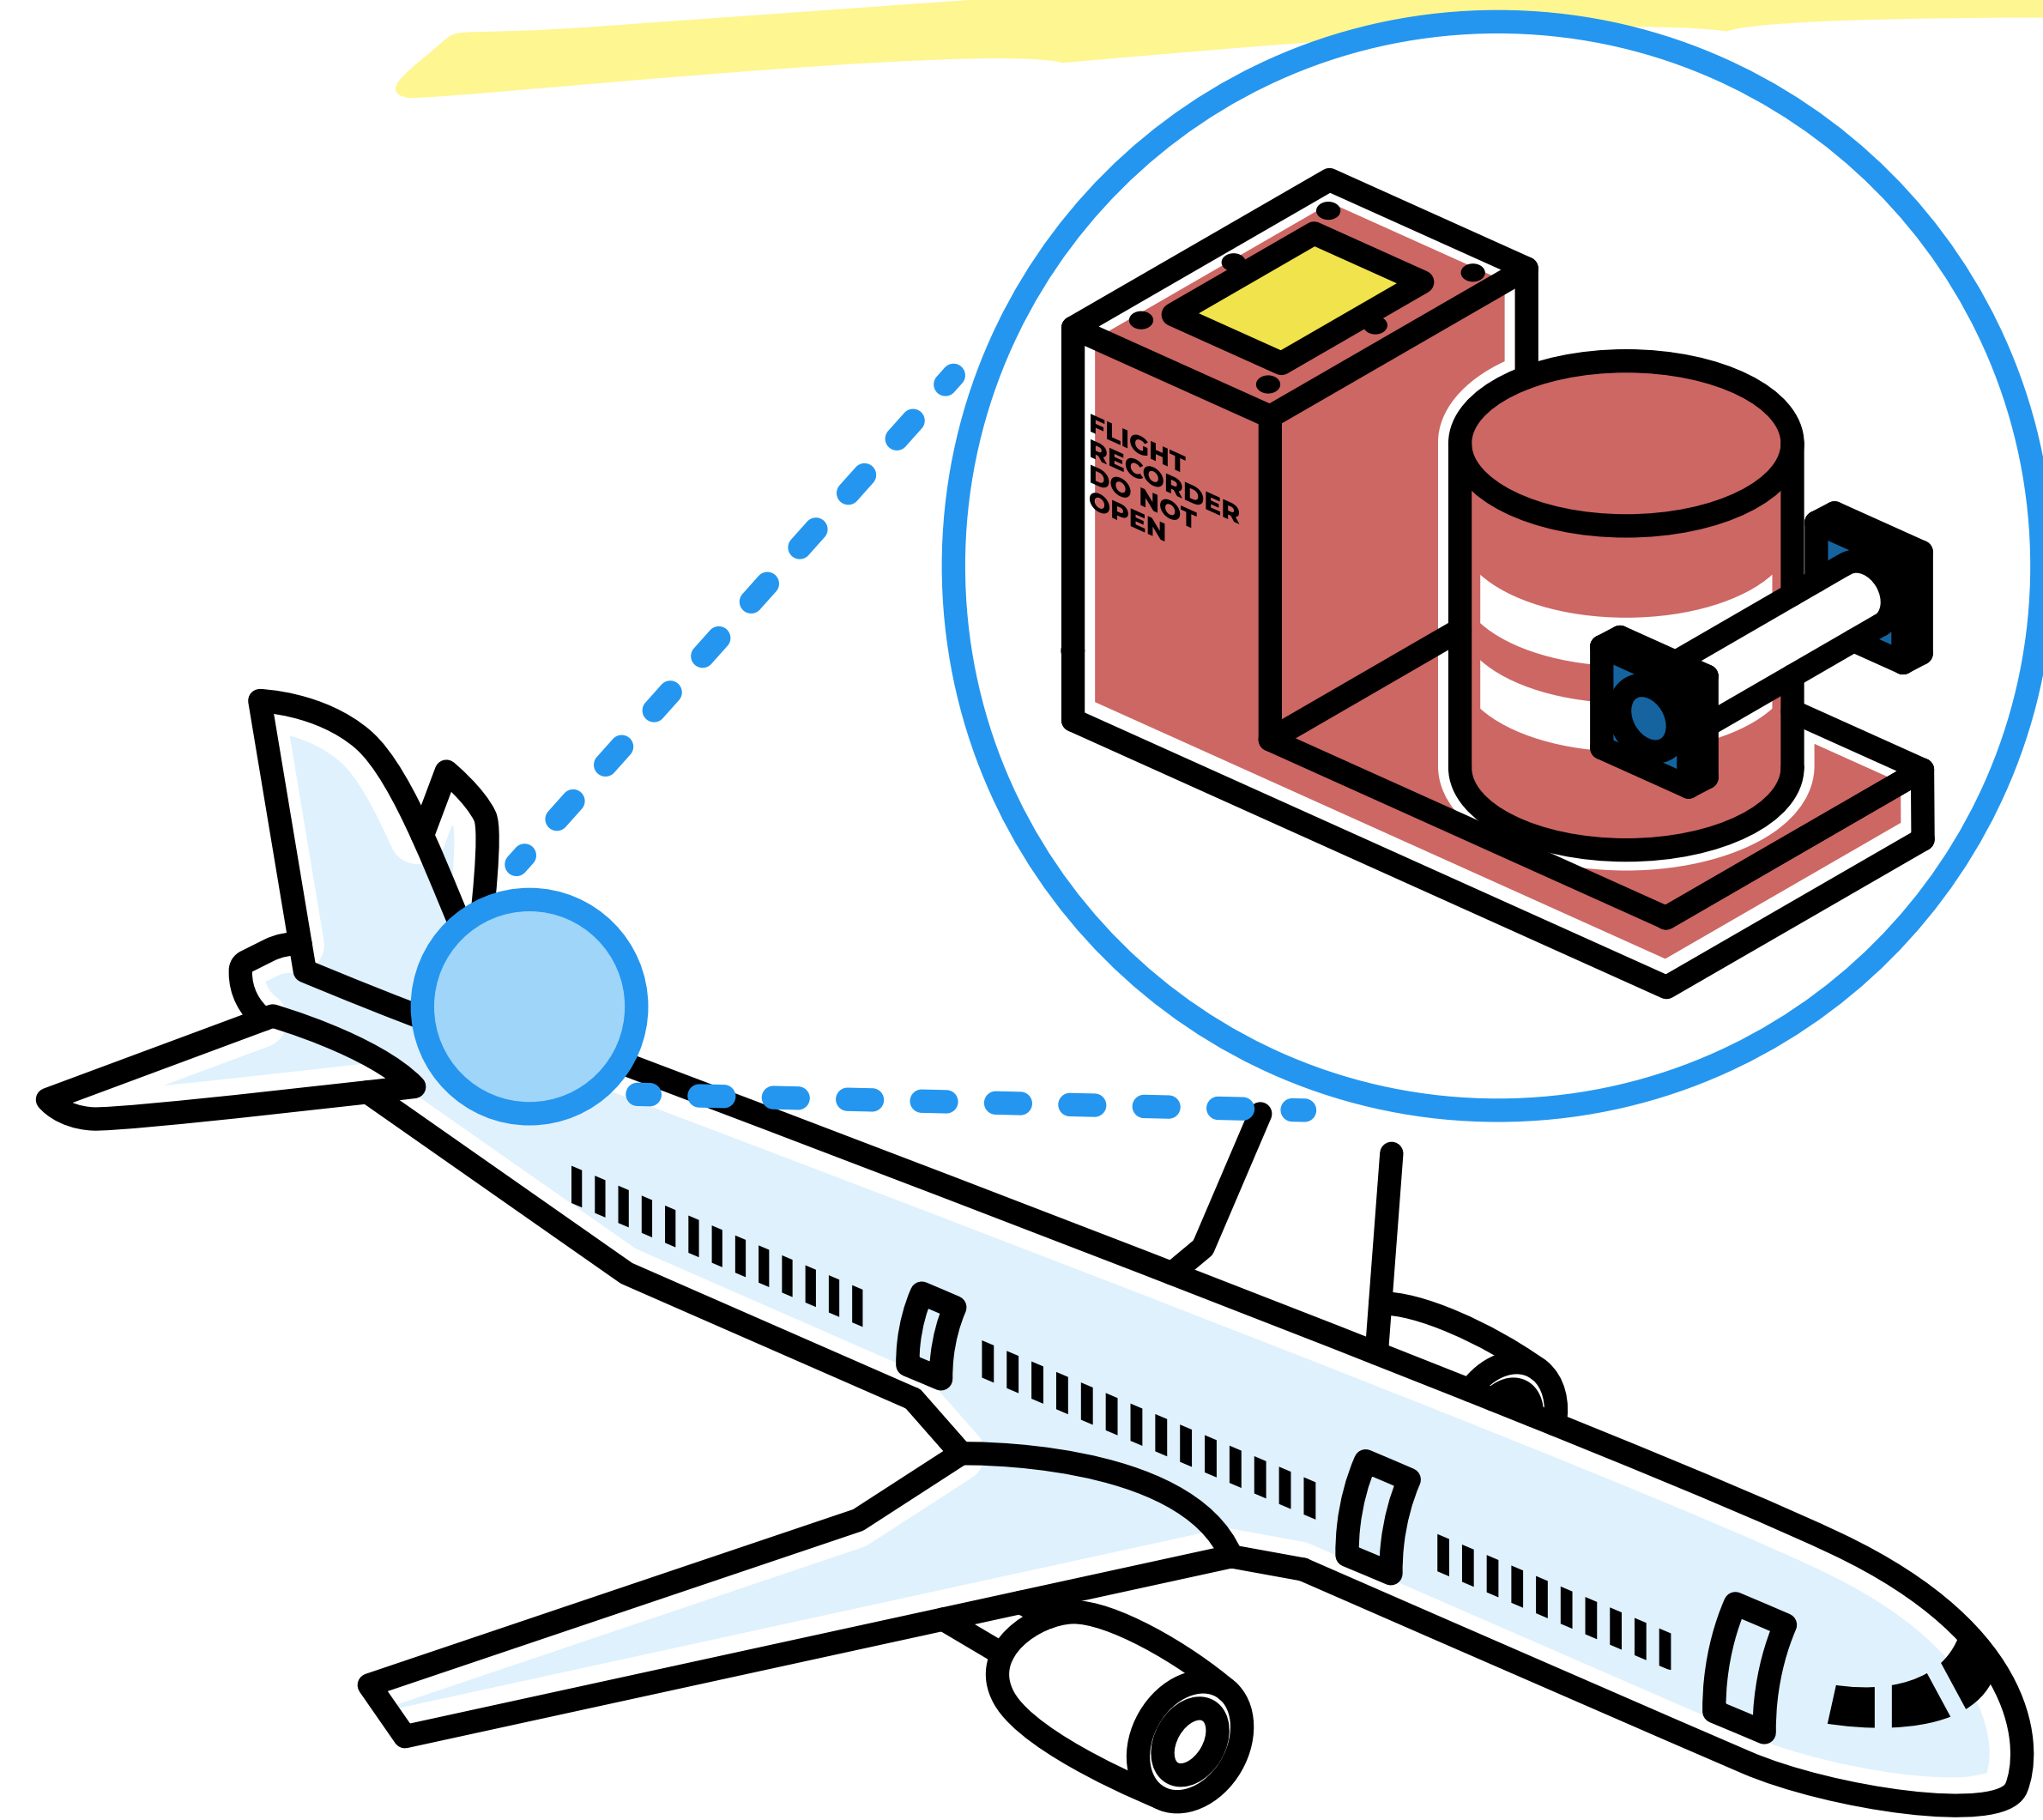

Any idea what that is?

Any idea what that is?

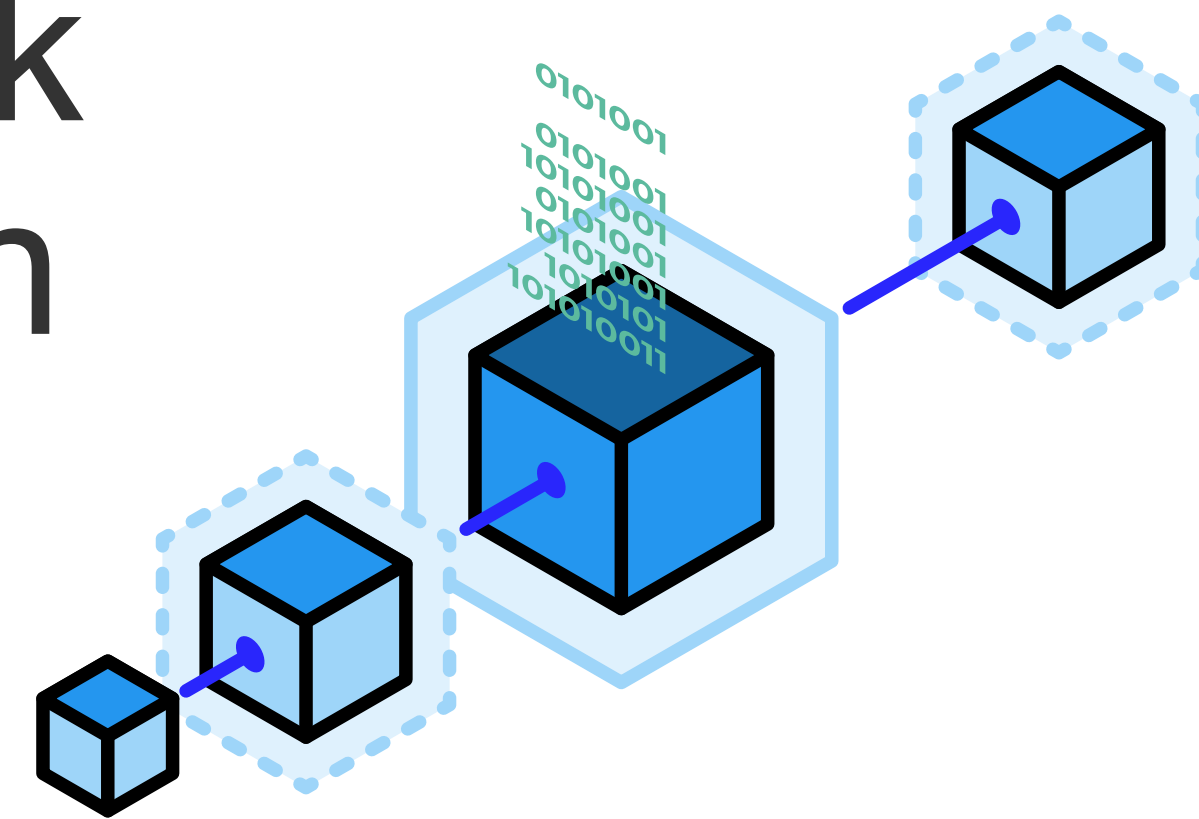

About Blockchains

- Blockchains are "flight recorders of DLTs"
- In best case they work and nobody needs to interact with them

About Blockchains

- You can find information of all transactions happened on a network in the blockchain
- The network and the current state can be recreated by executing the full blockchain
- Think about the statements of your bank account but with much more information

Facts and Figures

Decentralized innovation. Built on trust.

The Linux Foundation is a neutral, trusted hub for developers and organizations to code, manage, and scale open technology projects and ecosystems.

CLPR

Cross-Ledger Protocol

UNLOCKING TRAPPED ASSETS

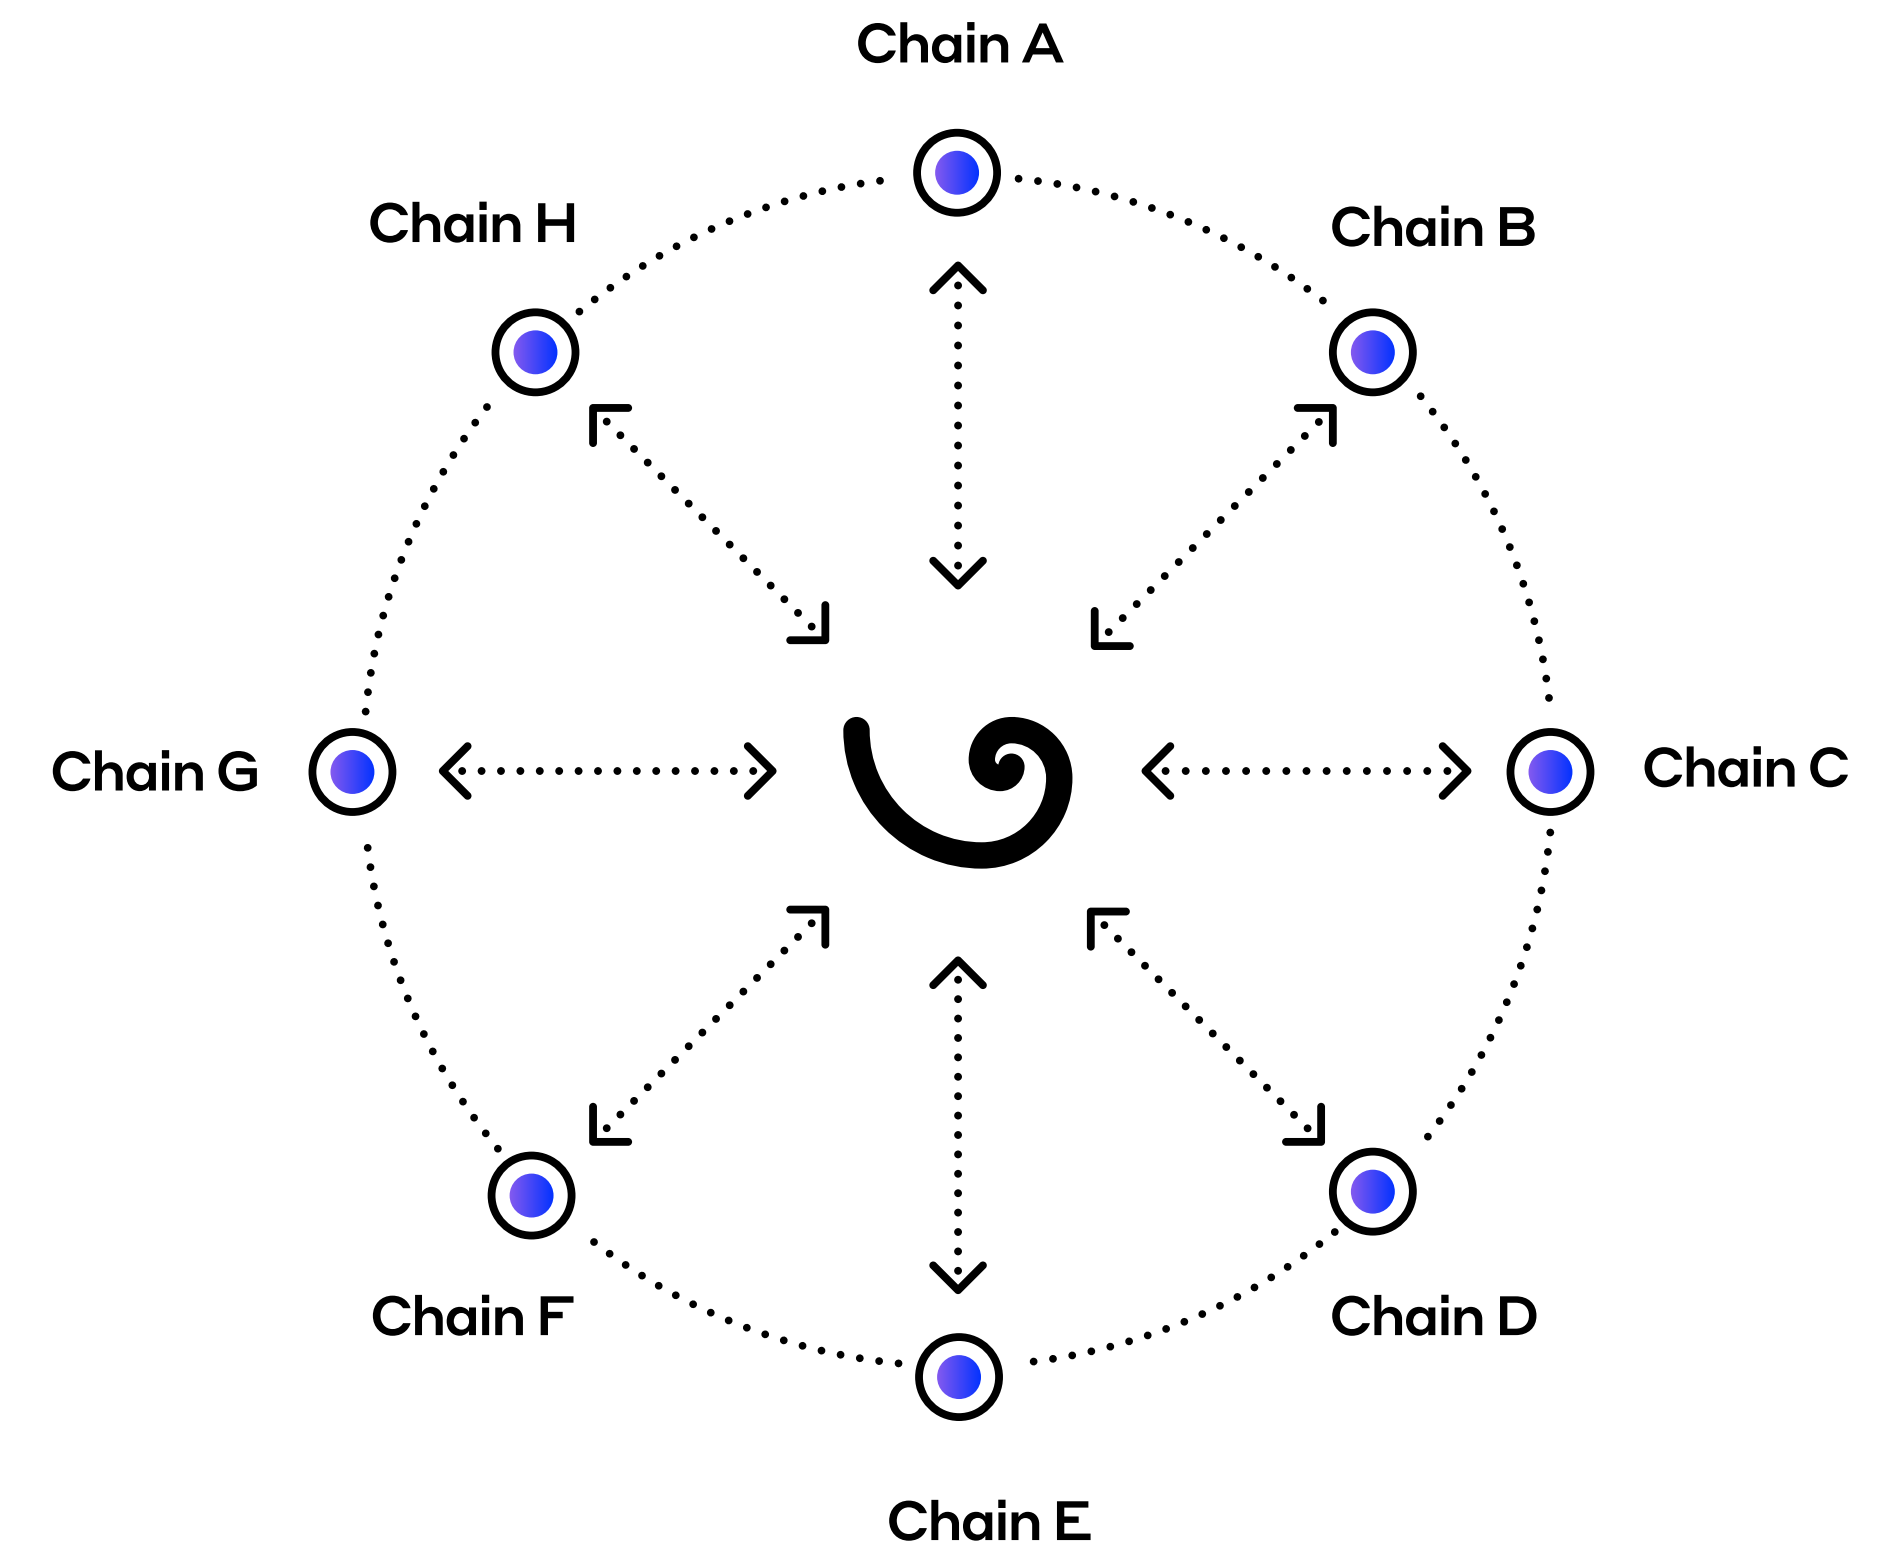

Introducing CLPR: the bridgeless Cross- Ledger Protocol

CLPR (“clipper”) is a new bridgeless Cross-Ledger Protocol developed by Hashgraph that enables cryptographically-secured communication and token transfers between independent blockchain networks—all without bridges, pooled liquidity or intermediary validator networks.

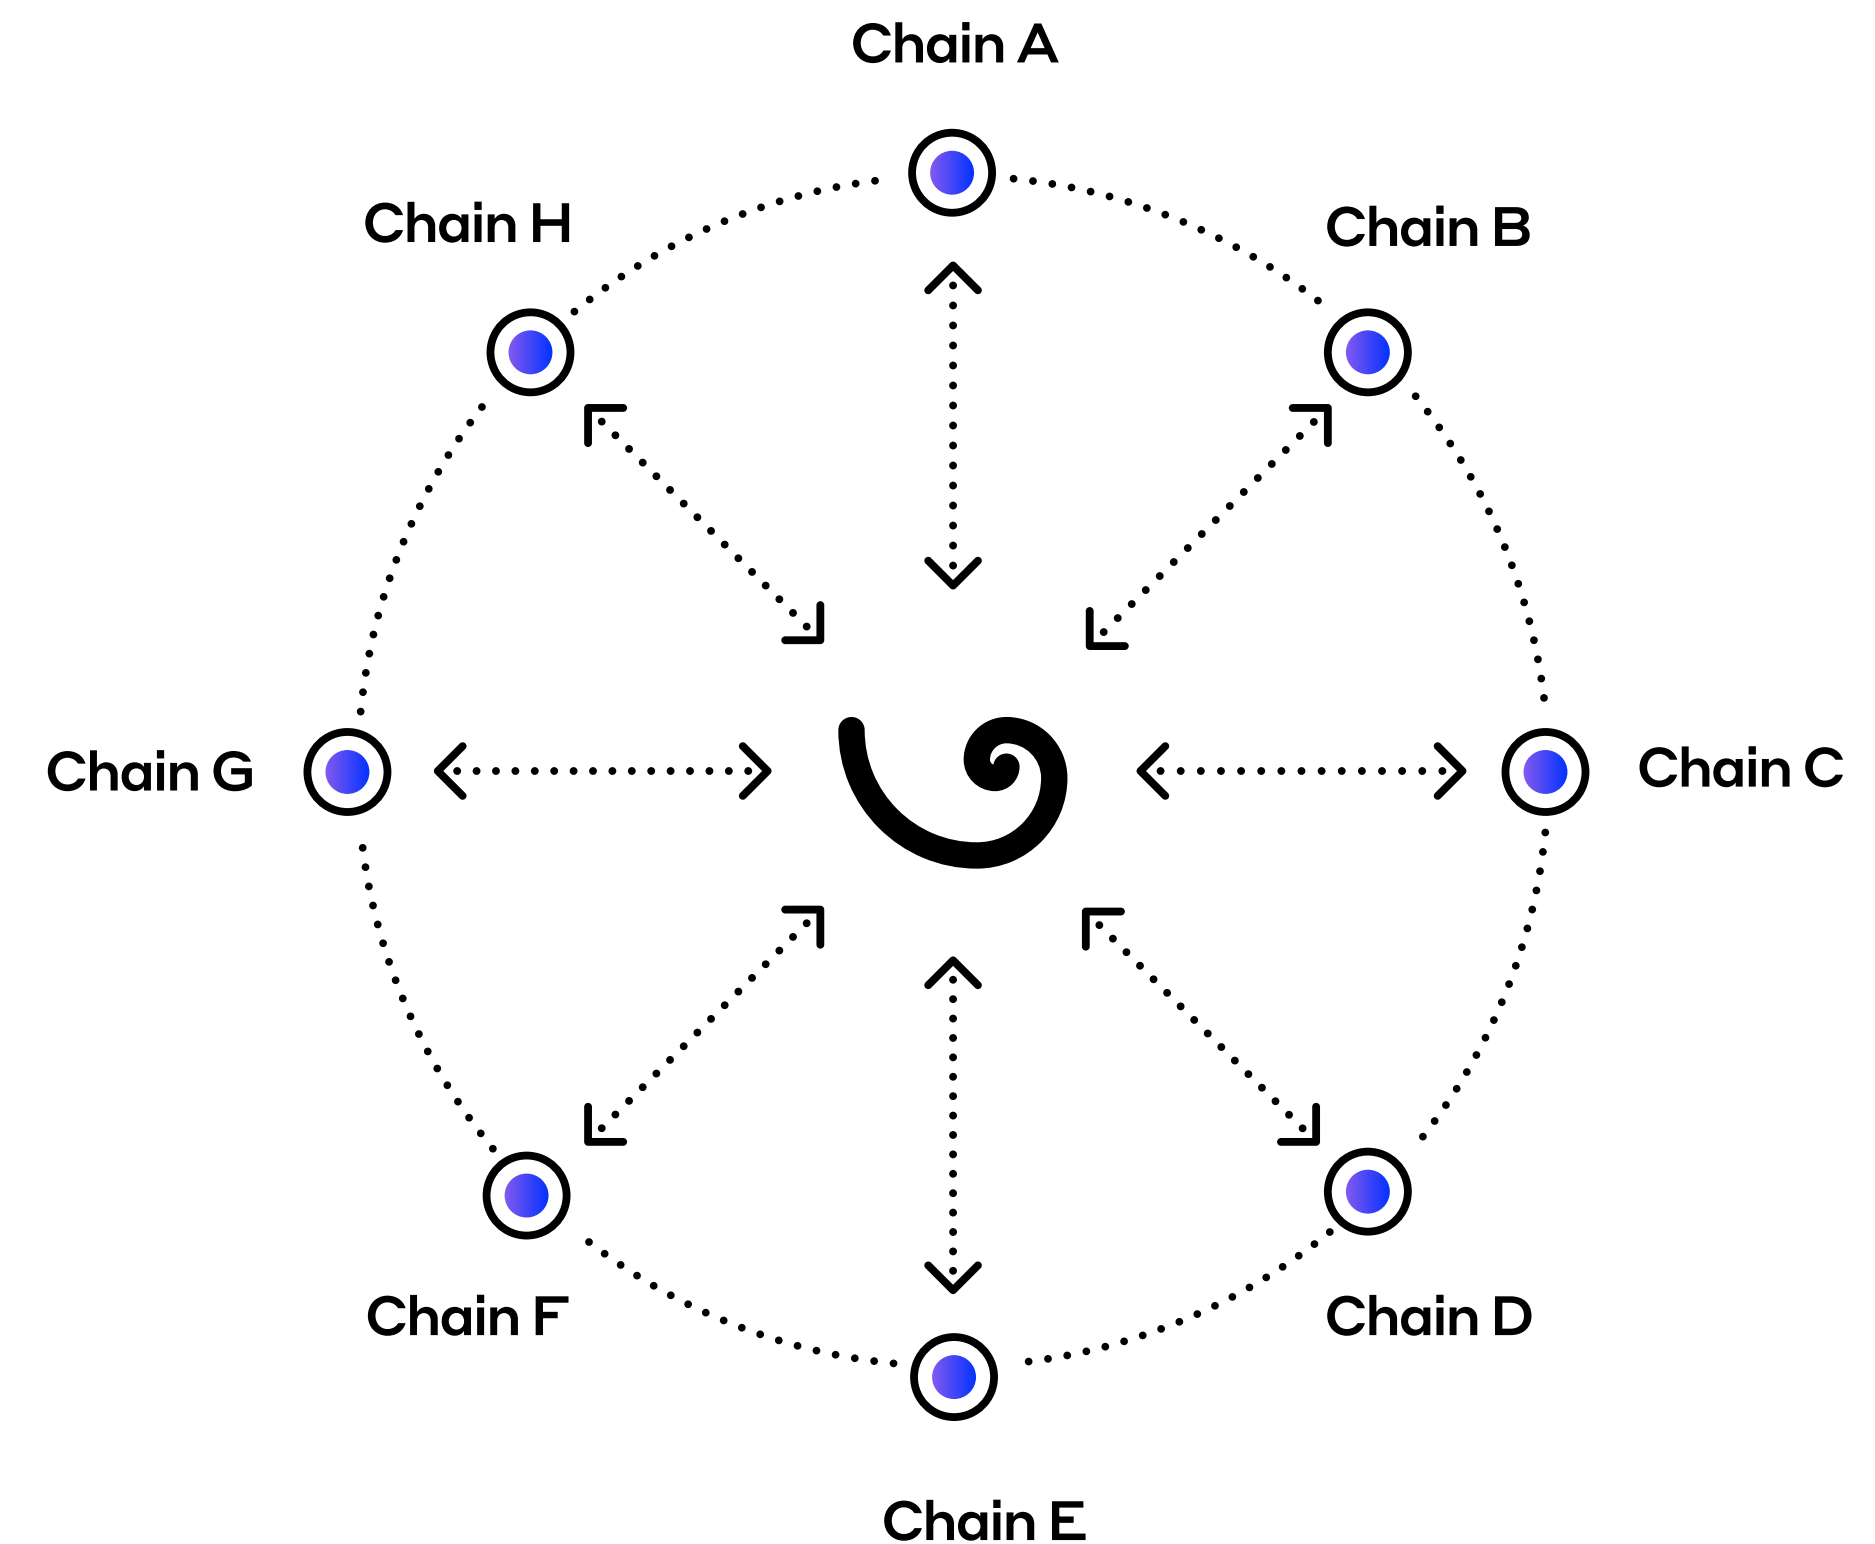

Cross-Ledger Protocol

- Each chain is a sovereign ledger: own consensus, token standards, ...

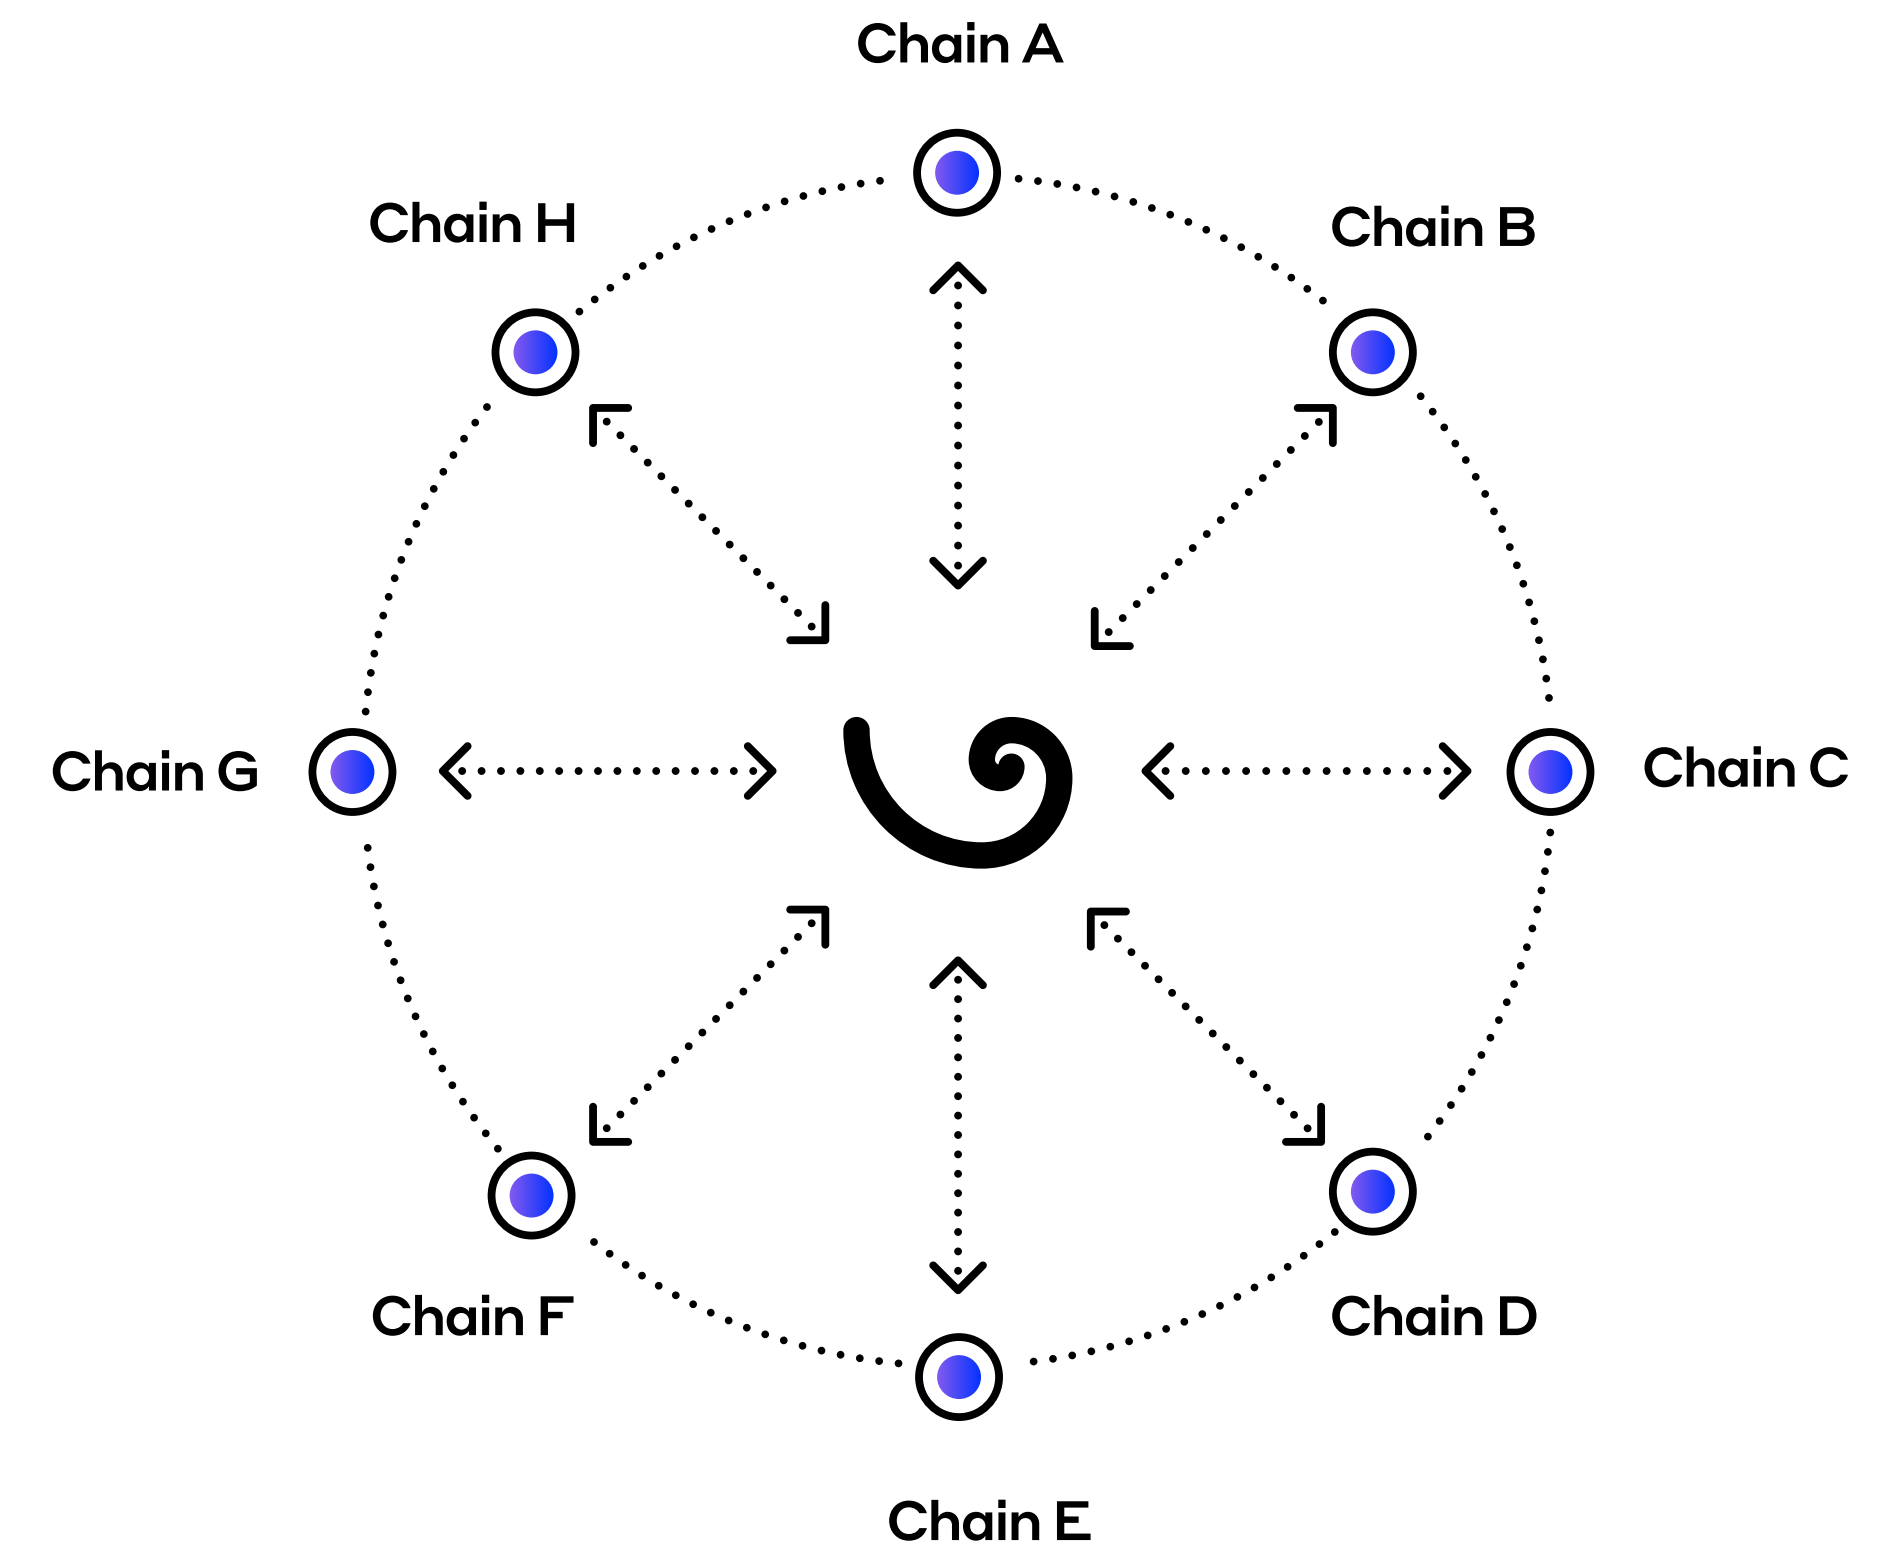

Cross-Ledger Protocol

- Each chain is a sovereign ledger: own consensus, token standards, ...
- Result: fragmented liquidity, "trapped assets" in isolated networks

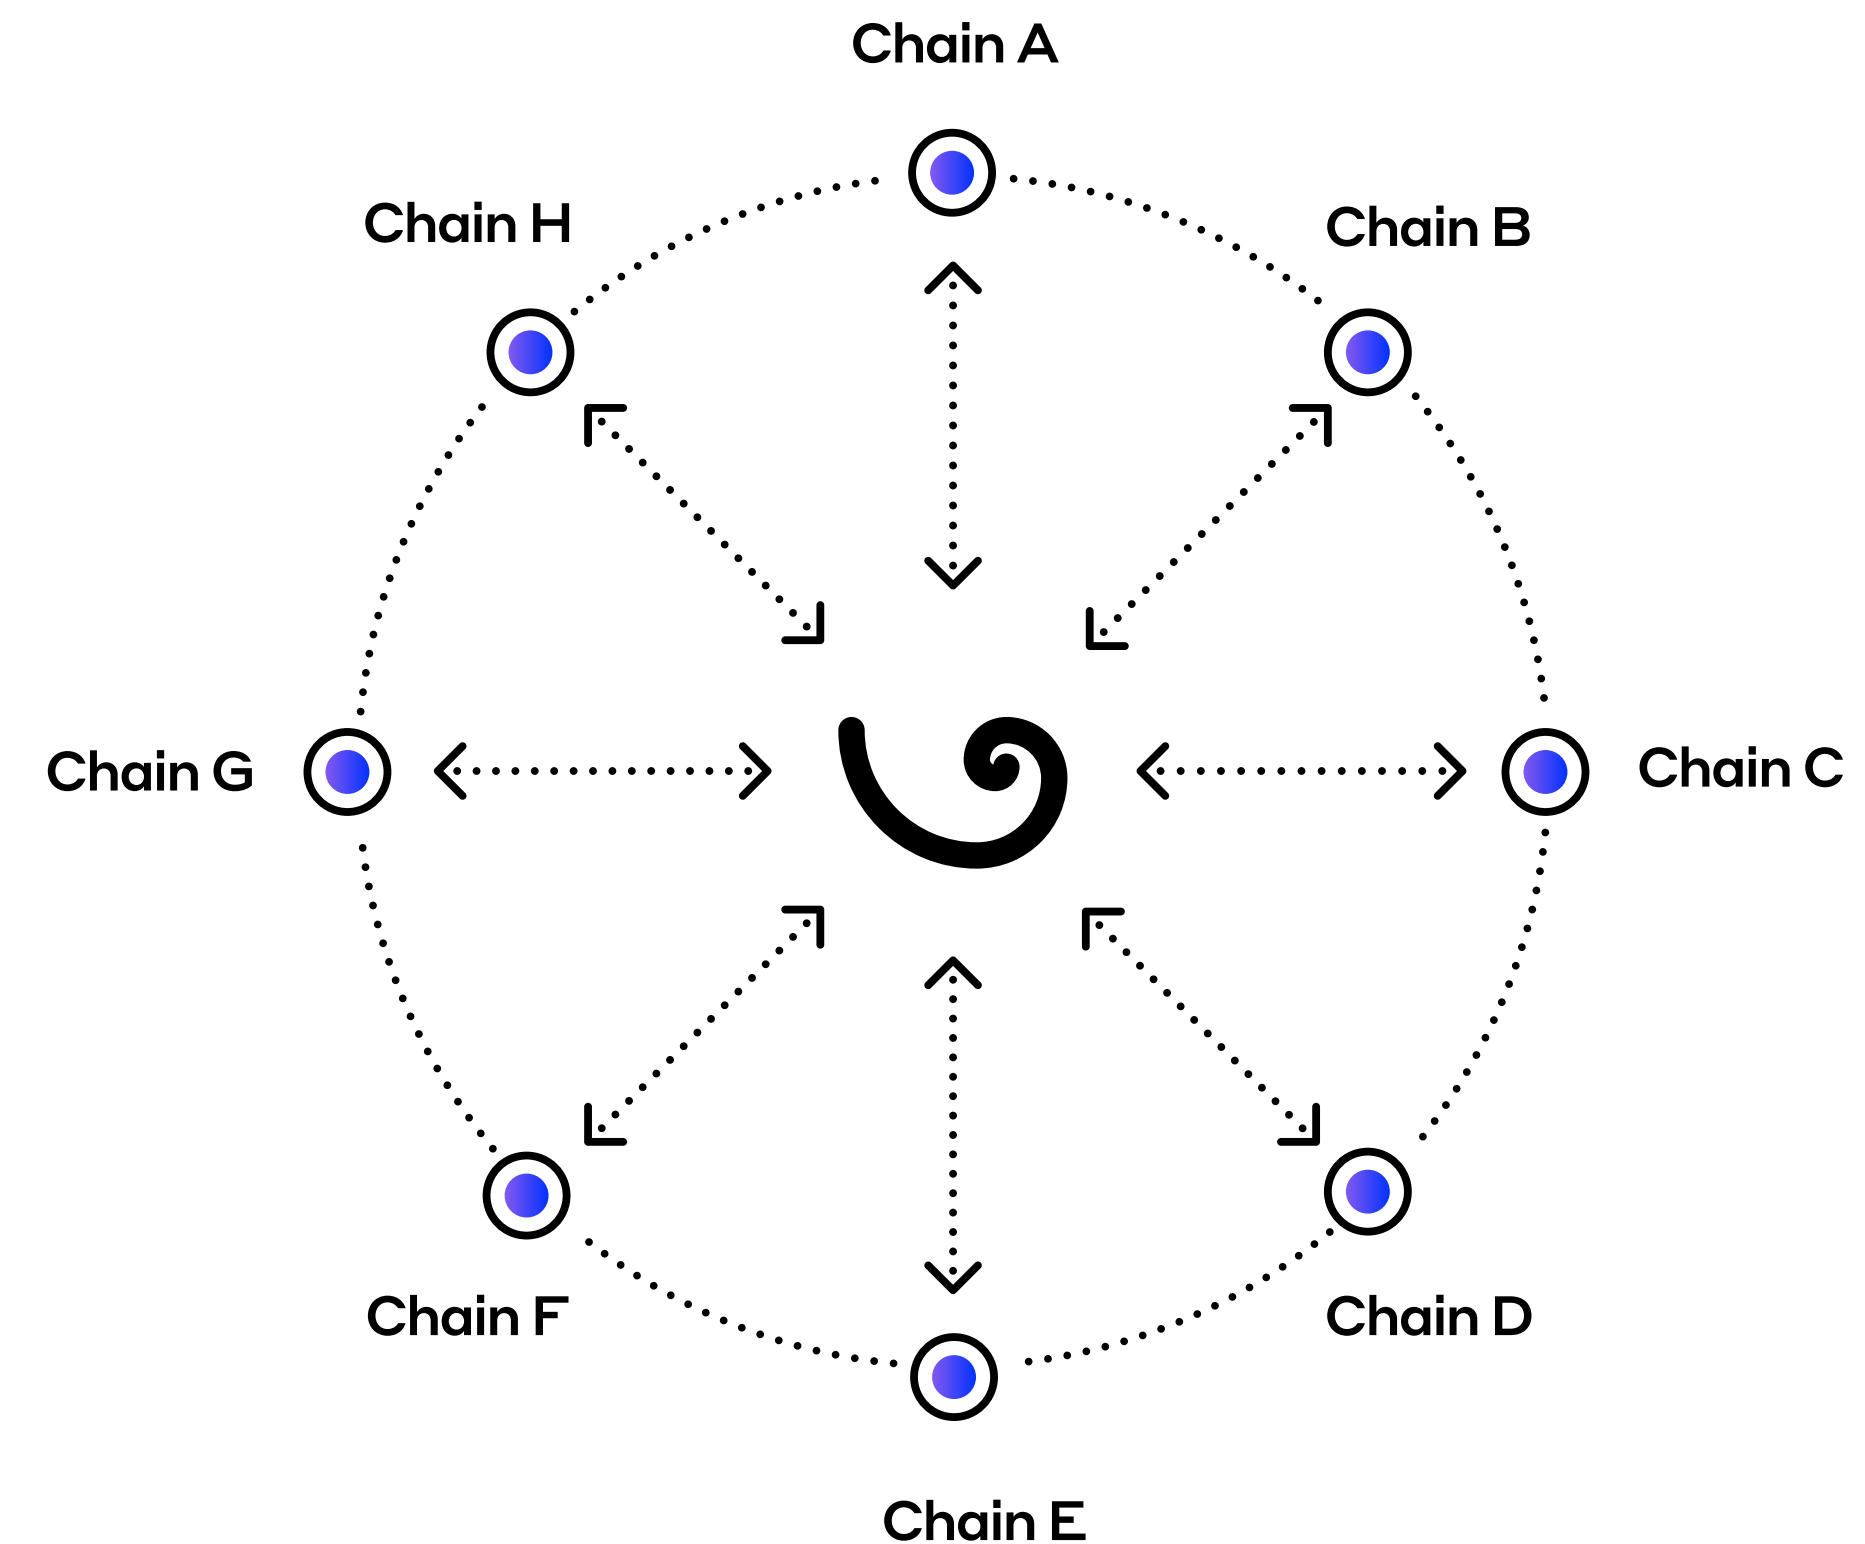

Cross-Ledger Protocol

- Each chain is a sovereign ledger: own consensus, token standards, ...
- Result: fragmented liquidity, "trapped assets" in isolated networks
- Bridges patch this but become the single point of failure and the ecosystem's largest attack surface

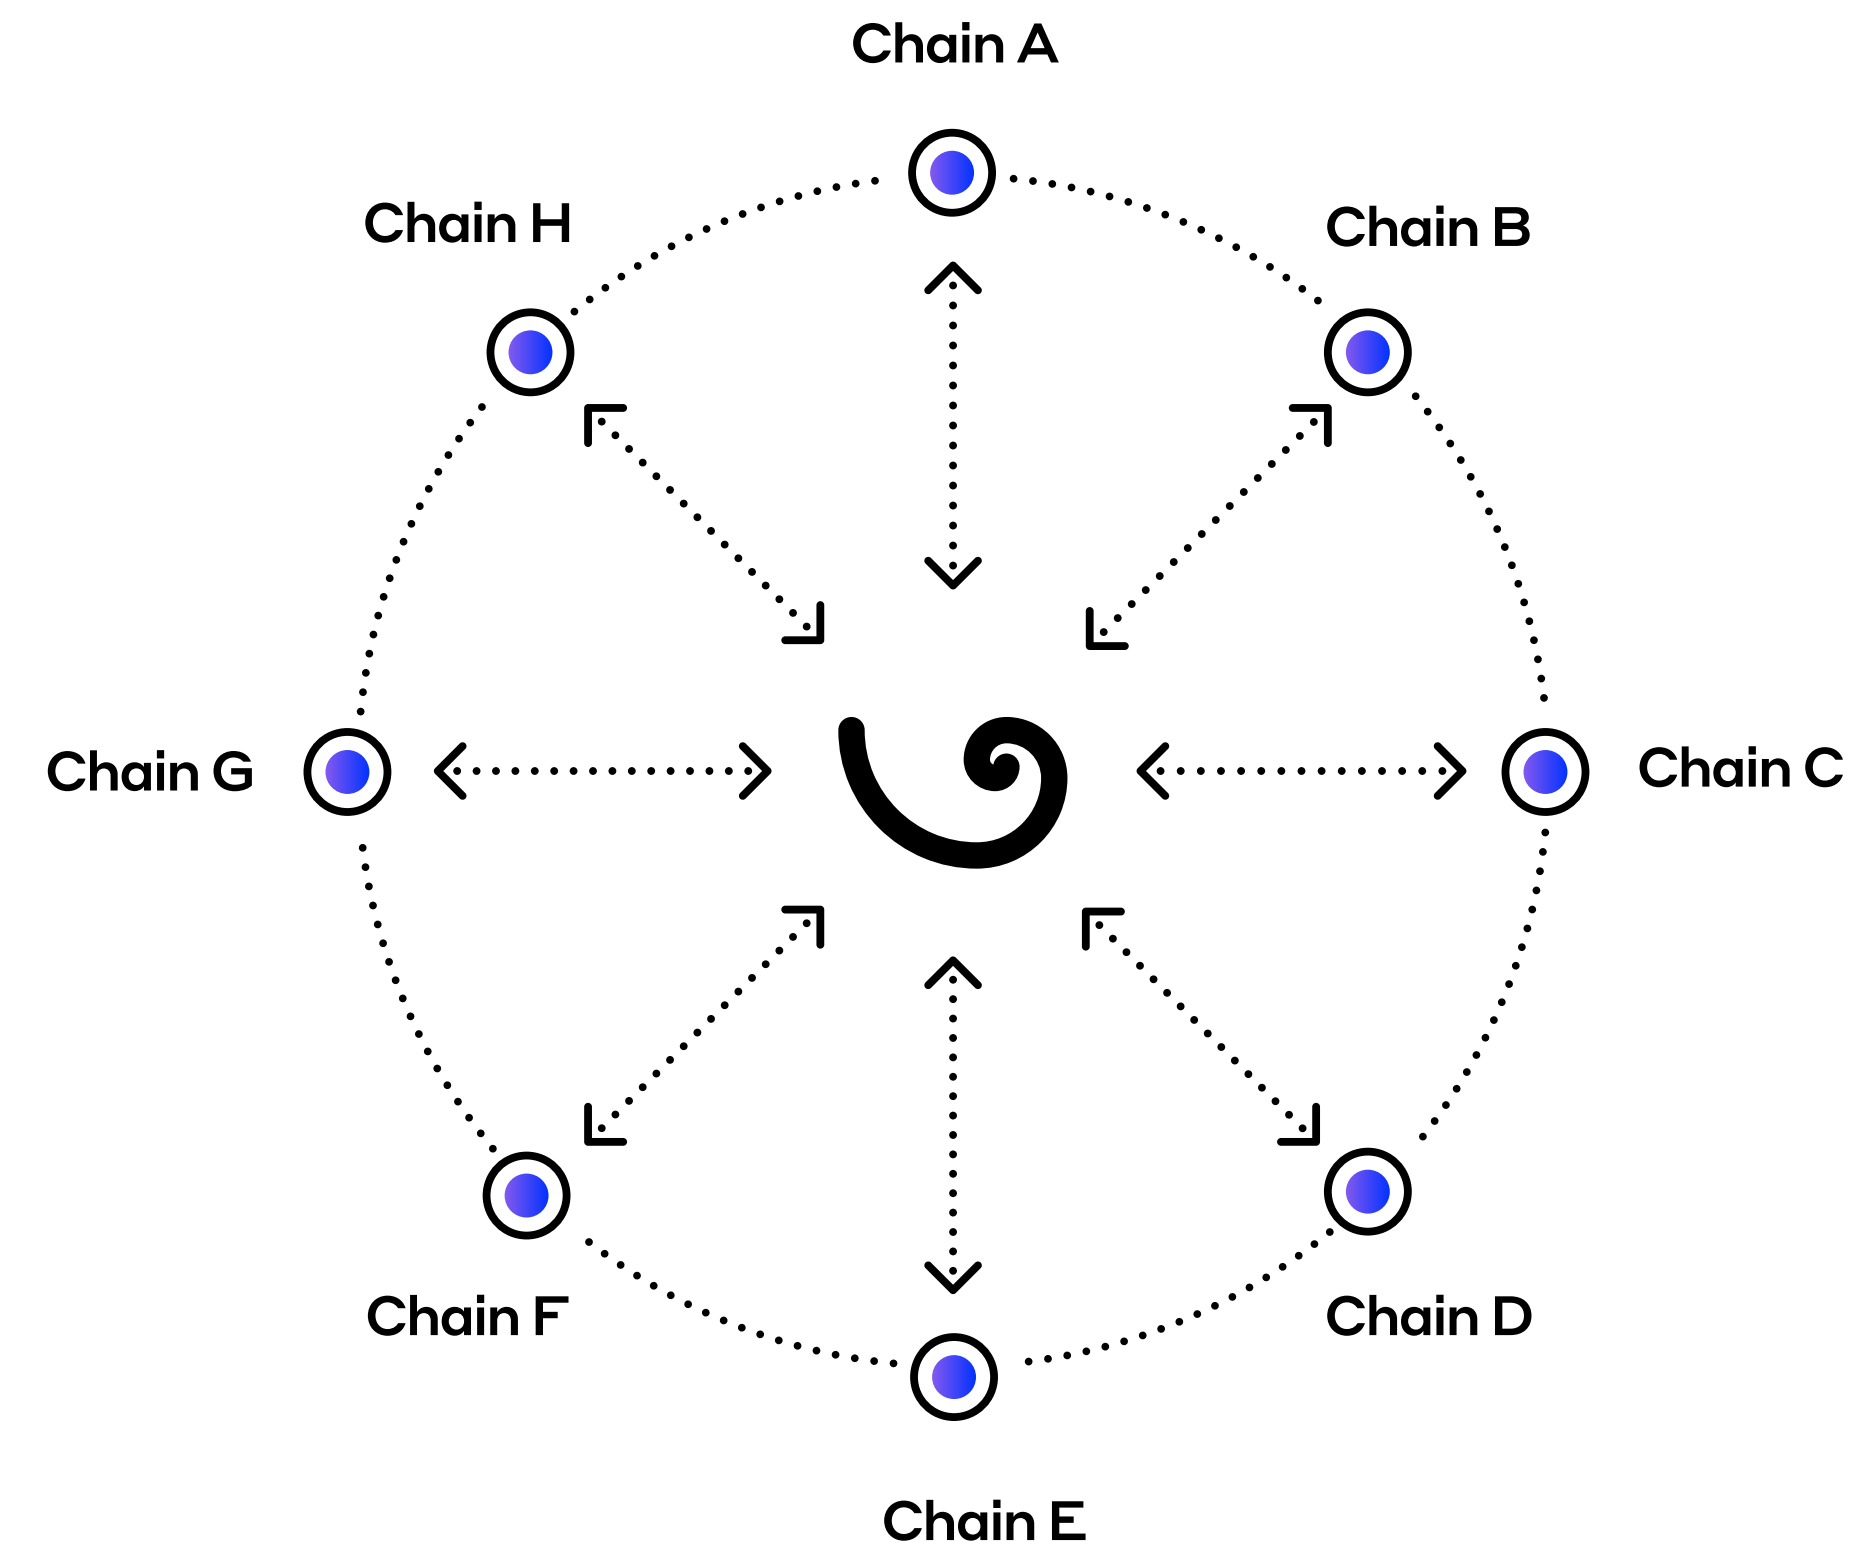

Cross-Ledger Protocol

- Each chain is a sovereign ledger: own consensus, token standards, ...
- Result: fragmented liquidity, "trapped assets" in isolated networks
- Bridges patch this but become the single point of failure and the ecosystem's largest attack surface
- CLPR: bridgeless trust is established directly between ledgers

Cross-Ledger Protocol

- Dedicated endpoints: a ledger runs CLPR endpoint servers that exchange proofs and settle transfers
- Native: once implemented natively, the validators themselves become the endpoints
- Hiero: Hiero nodes are the natural home for native integration and provide inter-Sphere settlement at consensus speed
