How SDKs Evolve as a Diverse Community Project

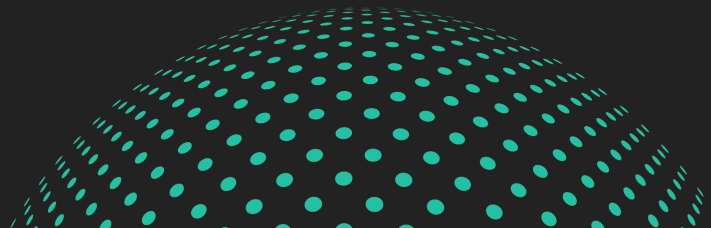

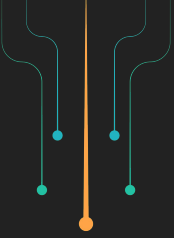

What a Community-Owned SDK Looks Like

- Releases cut by community maintainers, not gated on any one company
- PRs reviewed and merged without a corporate gatekeeper in the loop
- Design decisions made in public, community calls, proposals, not internal chat
- Maintainer team is majority non-corporate, multi-org
- SDK keeps shipping when any single contributor is unavailable

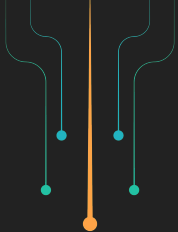

The Two-Tier Plan

- Hashgraph-maintained long term:
 - **JS**
 - **Java**
 - **Go**
 - Community-maintained long term:
 - **C++**
 - **Swift**
 - **Rust**
 - **Python**
- 

Handover Doesn't Happen by Itself...

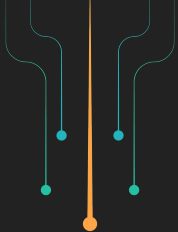

Outcome A: Community steps up	Outcome B: Nobody steps up
• Releases cut by community maintainers • PRs reviewed without Hashgraph in the loop • Design driven by people who use the SDK • Hashgraph becomes a contributor, not a gatekeeper • SDK stays relevant and ships new features • Project thrives	• Releases stall • PR backlog grows, contributors churn • Roadmap goes dark • Hashgraph steps away with no one to hand to • SDK enters maintenance-only mode • Project gets archived

The Contributor Ladder

- **MAINTAINER** → cut releases, own roadmap, represent SDK to TSC
- **COMMITTER** → review and merge PRs, own features end-to-end
- **JUNIOR COMMITTER** → label/assign/close issues
- **CONTRIBUTOR** → anyone; this is where you start

Every promotion is a public PR against `governance/config.yaml`, public and voted on by existing maintainers.

How You Move Up

- **Junior Committer:**
 - Consistent quality contributions
- **Committer:**
 - Demonstrated technical depth
 - Quality PR reviews
- **Maintainer:**
 - Sustained leadership
 - Roadmap engagement
 - Broader community trust

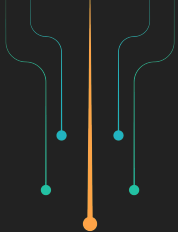

Ask directly: *"What do I need to show to be nominated?"*

Maintainers will have a concrete answer.

Real Promotions (These Happened)

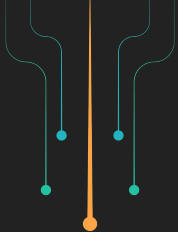

Governance PR	What Happened
<code>new committers python SDK proposal (#488)</code>	<code>Dosik13, Adityarya11, others → committers</code>
<code>add Manish to maintainers (#489)</code>	<code>manishdait: committer → maintainer</code>
<code>add adityarya11 as junior committer to cpp sdk (#557)</code>	<code>First junior committer in C++</code>
<code>add Akshat to committers, remove from triage (#535)</code>	<code>Akshat8510: triage → committer</code>

*Consistent contributions →
maintainer notices → nomination →
vote → promotion*

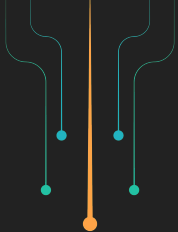

SDKs as One Project: Unified Triage

- **Before April 2026:** Per-language triage silos
 - e.g. a Python triager couldn't touch C++ issues
- **Now:** `hier-sdk-triage`
 - Single team, triage access on every SDK repo
 - 15 members across multiple organizations and countries
 - Junior committers here can triage Python, C++, Rust, Java, JS, Go, Swift, and TCK

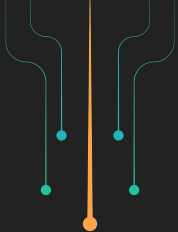

SDKs as One Project: Unified Teams

- governance PR #649 (open, not yet fully merge)
- If merged:
 - **hiero-sdk-committers: write access on all SDK repos**
 - **hiero-sdk-maintainers: maintain access on all SDK repos**
- Earn committer trust in one SDK → write access on all of them.
Become a maintainer anywhere → help govern every SDK.
- Each SDK's CODEOWNERS file still controls required reviewers
 - **e.g A C++ maintainer can't approve and merge Python code just because they're in the shared team.**

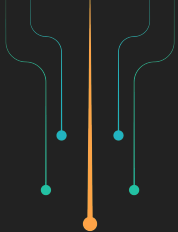

SDK Collaboration Hub

- Many active design proposals
 - **Any contributor can engage and influence what gets built**
- Per-language API guides
 - **Shared standards across all eight SDKs**
- Contributor onboarding curriculum
 - **Workflow, rebasing, DCO signing, Discord**
- Issue creation and triage guides
 - **For maintainers running a healthy project**
- V3 sandbox
 - **Early experiments for the next generation of SDKs**

A Diverse Community Matters

- Language expertise
- Use-case diversity
 - **Data scientists, mobile developers, embedded engineers shape what gets built**
- Organizational independence
 - **No single company should control any SDK**
- Geographic distribution
 - **Global contributors mean global time zones, global context**

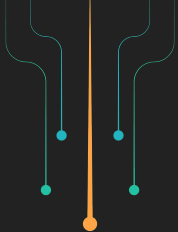

Proof the Model Works: Python SDK

- Created October 2024 and seeded by Hashgraph
- 18 months later:
 - **Monthly releases**
 - **~300 forks**
 - **~1,000 commits in 2025-2026**
 - **2 / 3 maintainers are community members**
 - **~60% commits are from non-corporate contributors**

Where Each SDK Stands

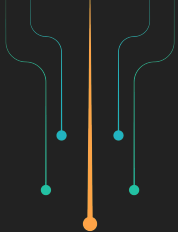

SDK	Maintainers	Committers	Status
Python	2 community + 1 Hashgraph	6 community	Model: fully community-driven
Rust	1 LaunchBadge + 1 LimeChain + 1 Hashgraph	3 LimeChain	Healthy structure, needs more community committers
C++	2 Hashgraph + 1 LimeChain	1 LimeChain + 1 community	Early stages, needs more community committers
Swift	2 Hashgraph	2 LaunchBadge	Most at risk: no community committers

What To Do Right Now

- **New Contributor**
 - Find a good first issue
 - Open a PR
 - Come to community call
- **Junior Committer**
 - Triage consistently
 - Write reviews
- **Committer**
 - Own features end-to-end
 - Engage on proposals

*If you want to move up,
say so!*

The Ask

- These SDKs need community members to become **junior committers, committers, and maintainers.**
 - They either get handed over... or archived
- The only missing piece is **people deciding it's worth their time.**

Thank you!
